## **Introduction**

In the spirit of scientific cooperation, the U.S. National Oceanic and Atmospheric Administration's (NOAA) National Geodetic Survey (NGS) contributes to future realizations of the International Terrestrial Reference Frame (ITRF) by providing the International Earth Rotation and Reference Systems Service (IERS) with local tie information for geodetic techniques co-located at IERS Network Sites considered a priority by that service. Within NOAA, these types of surveys are the responsibility of the NGS's IERS Site Survey (ISS) program.

During February of 2013, the NGS ISS program conducted a local tie vector survey at IERS network site FORT DAVIS. Three space geodetic technique (SGT) instruments are co-located at this site, consisting of a very long baseline interferometry (VLBI) radio telescope, a satellite laser ranging (SLR) system and one GNSS station. The radio telescope is a component of the National Radio Astronomy Observatory (NRAO) array and is known as the Fort Davis VLBA. The SLR, known as McDonald Laser Ranging System (MLRS), is operated by the University of Texas. The IGS tracking station at the McDonald Observatory Site is owned and operated by the U.S. National Aeronautics and Space Administration's (NASA) Jet Propulsion Laboratory (JPL).

This report documents the instrumentation, procedures, data analysis, and local tie information results associated with this survey.

## 1. Site description

IERS network site FORT DAVIS is located in the United States of America on two different land tracts near Fort Davis, Texas. The SLR and GNSS instruments are located at the McDonald Observatory on Mount Fowlkes, N30°41'W104°01'. The VLBA radio telescope is located at the Fort Davis National Radio-Astronomy Observatory (NRAO) within Sprout Ranch near the town of Fort Davis, Texas, N30°41'W104°01'.

## 2. Instrumentation

### 2.1. Tacheometers, EDMs, Theodolites

#### 2.1.1. Description

Two (2) Leica TDM5005 Electronic Tacheometer, S/Ns: 441698 and 441773 (Fig. 2)

##### Specifications

Angular measurement uncertainty:  $\pm 0.7''$

Distance standard deviation of a single measurement: 1 mm + 2 ppm

Figure 2: Leica TDM5005

#### 2.1.2 Calibrations

Tacheometers calibrated by Leica Geosystem AG Heerbrugg, Switzerland.

Inspection date: 08/15/2008 / 08/20/2008

Both instruments were found to be within factory specifications

#### 2.1.3 Auxiliary Equipment

Wild NL Collimator, S/N: 40145

Pointing accuracy, 1: 200,000 (Fig. 3)

Figure 3:  
Leica NL  
collimator

Hygrometer: Omega RH83 (Fig. 4).

Figure 4: Omega  
RH83

Thermometer: Digital thermometer, thermistor sensor, assembled by NGS (Fig. 5)

Figure 5: NGS Digital  
Thermometer

Barometer: Leitz AIR-HB-1L, S/N: 1L1890 (Fig. 6)

Figure 6:  
Leitz AIR-  
HB-1L

## 2.2 GPS units

### 2.2.1 Receivers

Four (4) Trimble NetR5 GPS L1 C/A Code, L2C, L1/L2/L5I Full Cycle Carrier, GLONASS L1 C/A Code, L1 P Code, L2 P Code, L1/L2 Full Cycle Carrier with Maxwell™ Custom Survey GNSS Chip (Fig. 7)  
P/N: 62800-00, S/Ns: 4619K01307, 4624K01584, 4624K01631 and 4624K01648

Specifications for Static GPS Surveying:  
Horizontal: +/- 5 mm + 0.5 ppm RMS  
Vertical: +/- 5 mm + 1 ppm RMS

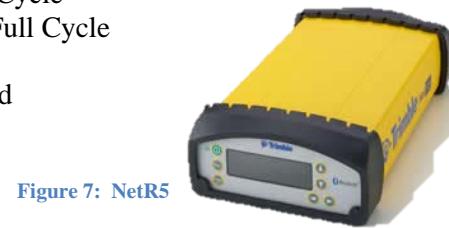

Figure 7: NetR5

### 2.2.2 Antennas

Four (4) TPSCR.G3, Topcon GPS/GLONASS/Galileo choke ring antenna, model CR-G3 (Fig. 8)  
P/Ns: 1-044301-01, S/Ns 383-1613, -1614, -1626 and -1628

Figure 8: CR-G3

### 2.2.3 Analysis software, mode of operation

Post-processing and adjustment were undertaken using NGS's beta version of Online Positioning User Service (OPUS) Projects, an interactive web page. Data is tagged with a project identifier and on the OPUS web page and uploaded normally. OPUS Projects sorts the data into sessions. User must log in, select a session and reconfigure it if desired before starting the processing. Processing reports are generated and interactive tables display a summary of results. Processed base lines are made available for the adjustment phase. The user is allowed limited flexibility in setting adjustment parameters. Processing and adjustment results are automatically forwarded to user via email.

## 2.3 Leveling

### 2.3.1 Leveling instruments

Leica DNA03 digital level, P/N: 723289, S/N: 332228. (Fig. 9)  
Height measurement accuracy, +/-0.3 mm per km, double-run.

Figure 9: DNA03

### 2.3.2 Leveling rods

Leica GWCL92 92-cm Invar Bar Code Rod  
S/N: 30721 (Fig. 10)

Figure 10:  
GWCL92  
92 cm

Leica GPCL3 3-m Invar Bar Code Rod  
S/N: 27226 (Fig. 11)

Figure 11:  
GPCL3  
3 meters

### 2.3.3 Checks carried out before measurements

Daily instrument collimation test procedures were undertaken on-site prior to data collection. Leveling rod bubbles were checked daily, prior to use.

## 2.4 Tripods

Chosen for high stability, low coefficient of thermal expansion and ease of use, wooden stands were constructed and anchored into place by the survey team over the seven main scheme, ground network station marks; 7851, MLRS-TLRS, 7850 RM 2, NGS 1, FT DAVIS VLBA RMs 1, 2 and 3. The design is the one used by the U.S. Coast and Geodetic Survey for first-order work instead of conventional tripods (Figure 12).

Adjustable aluminum plates were fastened to the tops of each stand and a Leica tribrach was attached and centered precisely over the survey mark using a Leica NL4 collimator. The tribrach was “leveled up” with a Leica carrier with a longitudinal bubble. Heights above the survey mark were then measured using a Leica DNA03 digital level instrument and barcode rod to the top of a tribrach adapter set into the tribrach. To compute the height of a tacheometer or target that has been set into the tribrach, a height constant of 0.1675 m is added to the leveled height.

Some points were not needed in the determination of SGT tie vectors, but were included because of their presence in prior site surveys. These supplemental points were not occupied, but rather measurements were made to them from main scheme network stations. Custom-made aluminum trivets were used to center targets/reflectors over these five survey marks; 7080, 7850 RM 3, 7850, CAL PIER 3 and JPL 4010 S over (Fig. 13). Target/reflector heights were measured by differential leveling using a method similar to previously described.

Figure 12: Typical U.S Coast and Geodetic Survey wooden stand built over FT DAVIS VLBA RM 2. The three-legged stand is anchored solidly into the ground. The stones are “extra.” The stand is surrounded by a completely detached observer’s platform.

Figure 13: NGS trivet used on supplemental points

## 2.5 Forced centering devices

Leica GDF321 tribrachs (Fig. 14) were fastened to centering plates that were attached to the tops of the wooden stands for the duration of the project. In this fashion, tribrachs were plumbed precisely over the survey disk using the NL Collimator (Fig. 15).

Figure 14: GDF321 Tribrach without Plummet

The tribrach was “leveled up” using a GZR3 carrier with longitudinal bubble (Fig. 16). That is, the carrier’s standing axis was brought into alignment with the local gravity vector using the tribrach’s footscrews. A tribrach adapter (Fig. 17) was used as a vertical point of reference in determining instrument and target height above the mark. Digital leveling equipment was used to determine this height. An offset constant of 0.1675 m has been determined from the top of the tribrach adapter to 1) the center of the tilt axis of the tacheometer’s telescope and 2) the center of the GPH1A target.

Figure 15: NL Collimator used to center the tribrach

Figure 16: GZR3 Precision Carrier

Figure 17: Top of tribrach adapter used for setup’s vertical point of reference

## 2.6 Targets, reflectors

Except for the intersection observations at the IGS tracking station, MCDONALD CORS MONUMENT (MDO1), Leica GPH1P precision reflectors (Fig. 18) were used as needed for tacheometer observations, acting as both target and reflector. For each reflector, the manufacturer-provided offset values of -34.4 mm were validated prior to the survey. The target, when attached to a carrier and seated in a tribrach, was an additional 0.1675 meter higher than the measured height to the top of the tribrach adapter.

Figure 18: GPH1P Precision surveying monitoring prism

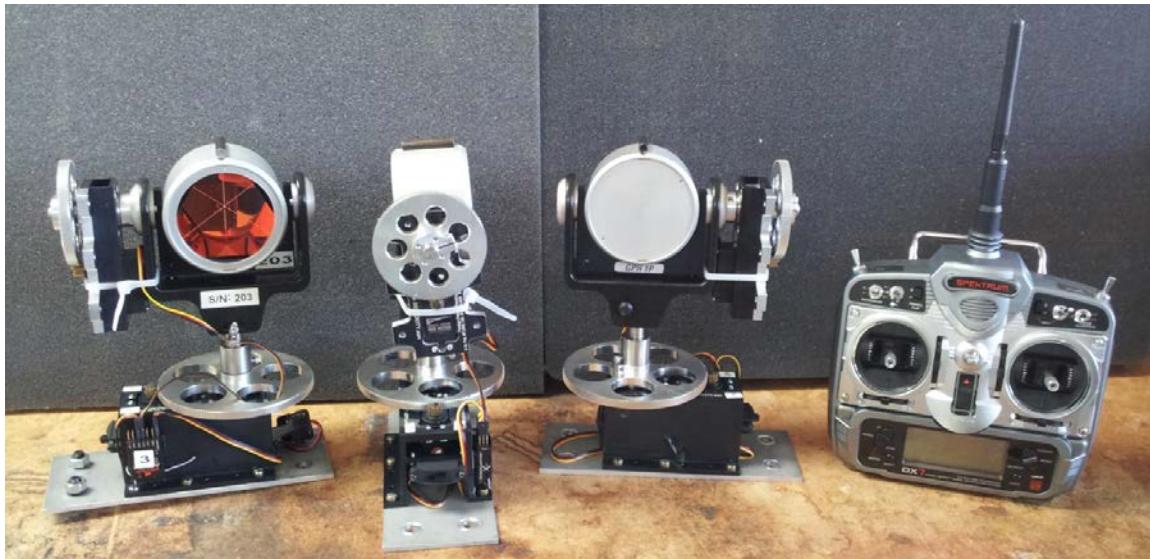

Figure 19 – GPH1P outfitted with two R/C servos (pan and tilt axes) to allow precise pointing of target from remote location (tacheometer).

To minimize the loss of precision in distance measurement, the GPH1P are precisely pointed back to the tacheometer. To that end, the GPH1Ps used on the SLR and radio telescope measurements were mounted to sturdy, radio-controlled, pan-tilt units (Fig. 19). The pan-tilt units were then remotely pointed to the tacheometer by the observer after each motion of the SLR/radio telescope.

## 3. Measurement Setup

### 3.1 Ground network

The ground network consists of two categories of marks; main scheme and supplemental. Main scheme marks are tied together in a local coordinate system with repeated and extremely precise horizontal and vertical angle measurements and distance measurements. These marks are used to tie the SGT instruments directly to the network, and indirectly, to each other. Supplemental marks are accurately positioned relative to the network, but do little or nothing to enhance the network. Supplemental marks may be reference marks for the SGT instruments, marks of special interest, or marks from a previous site survey. Tying to marks from previous surveys provides additional information about past and present ground networks.

The following marks were found in a SINEX file (Table 2) stored at the IERS web site (<http://itrf.ign.fr/ties/40442.snx>). Of the 10 points listed, four were recovered and included in the current survey. The remaining six had either been destroyed or are inaccessible for various reasons.

**Table 3: Cross-referenced Listing of Points. Information regarding previous surveys was provided by Allied Signal Technical Services (ASTS).**

#### Main-Scheme Marks

**7851** is a NASA control mark set in top of a mobile SLR pad and was originally established to serve as a reference mark for the associated SLR instrument.

**7850 RM 2** is a NASA control reference mark set in outcropping bedrock and was originally established to serve as a reference mark for the associated SLR instrument.

**MLRS TLRS** is a rod mark driven to an unknown depth inside a grease-filled sleeve of unknown depth inside of a PVC pipe with logo cap established by NASA to serve as a reference mark for the McDonald Laser Ranging System (MLRS) telescope's CRP.

**NGS A** is a survey disk set in the top NE corner of a concrete vault projecting 40 cm above the ground. It was set at this time as the third ground network mark needed to properly tie the MCDONALD CORS MONUMENT (MDO1) to the network.

**FT DAVIS VLBA RM 1** is a rod mark driven to an unknown depth inside a grease filled sleeve of unknown depth inside of a PVC pipe with logo cap established by the National Aeronautical and Space Administration (NASA) to serve as a reference mark for the NRAO VLBA radio telescope CRP.

**FT DAVIS VLBA RM 2 and FT DAVIS VLBA RM 3** are NASA survey disks reported to have been set in bedrock which is about 0.5 m below the surrounding ground depth. Access to these marks is had through a PVC pipe with log cap. NASA established these marks to serve as reference marks for the NRAO VLBA radio telescope CRP.

#### Supplemental Marks

**7850** is a NASA control mark set in top of a mobile SLR pad and was originally established to serve as a reference mark for the associated SLR instrument.

**7850 RM 3** is a NASA control reference mark set in outcropping bedrock and was originally established to serve as a reference marks for the associated SLR instrument.

**CAL PIER 3** is a forced centering device set in the top center of a concrete pier monument established by NASA to support calibration of the MLRS instrument.

**JPL 4010 S** is a stainless steel disk set in top of a concrete pier monument at the VLBA site. The Jet Propulsion Laboratory (JPL) set this monument originally to serve as a GNSS station, but that plan has not come to fruition.

#### SGS Instrument Reference Marks

**7080** is a NASA control mark set in a mobile SLR pad directly beneath Mirror #6 and at the south edge of the northern-most leveling jack of the McDonald Laser Ranging Station (MLRS) instrument. The mark has served as the reference mark for the MLRS.

**MCDONALD CORS MONUMENT (MDO1)**  
is the center point of a stainless steel plate, 30 cm in diameter, set in the top of a 50 cm in diameter concrete post projecting 20 cm above the ground. The mark is enclosed in a transparent radome.

**Figure 20:**  
**MDO1**  
**w/choke ring**  
**antenna**

### 3.1.2 Maps of Network

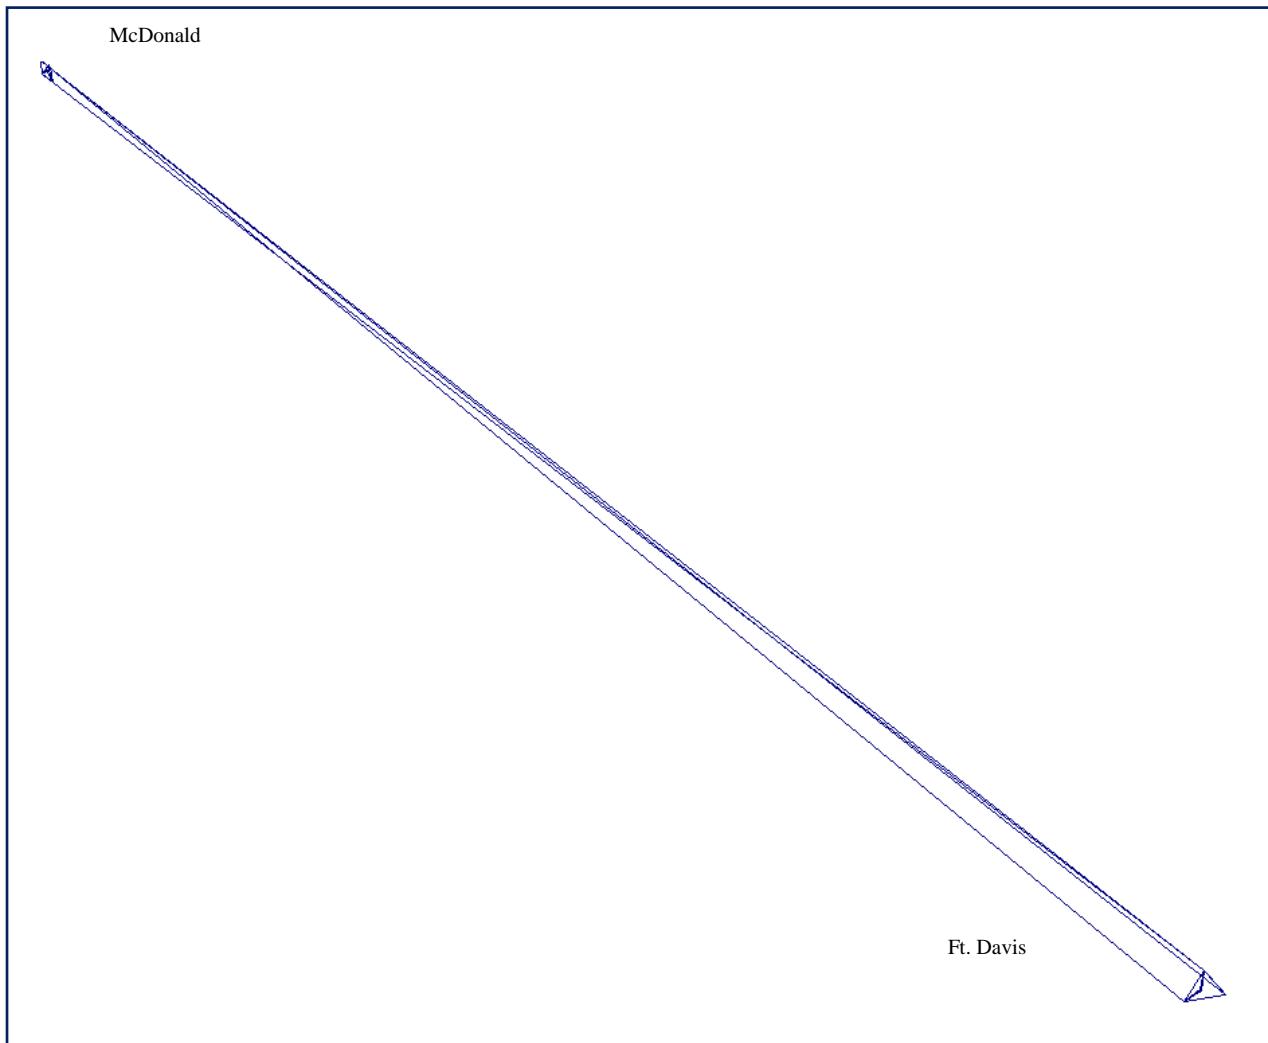

Figure 21: Sketch showing GPS vectors tying two sub-networks together, which are approximately 8 km apart.

## McDonald Sub-network

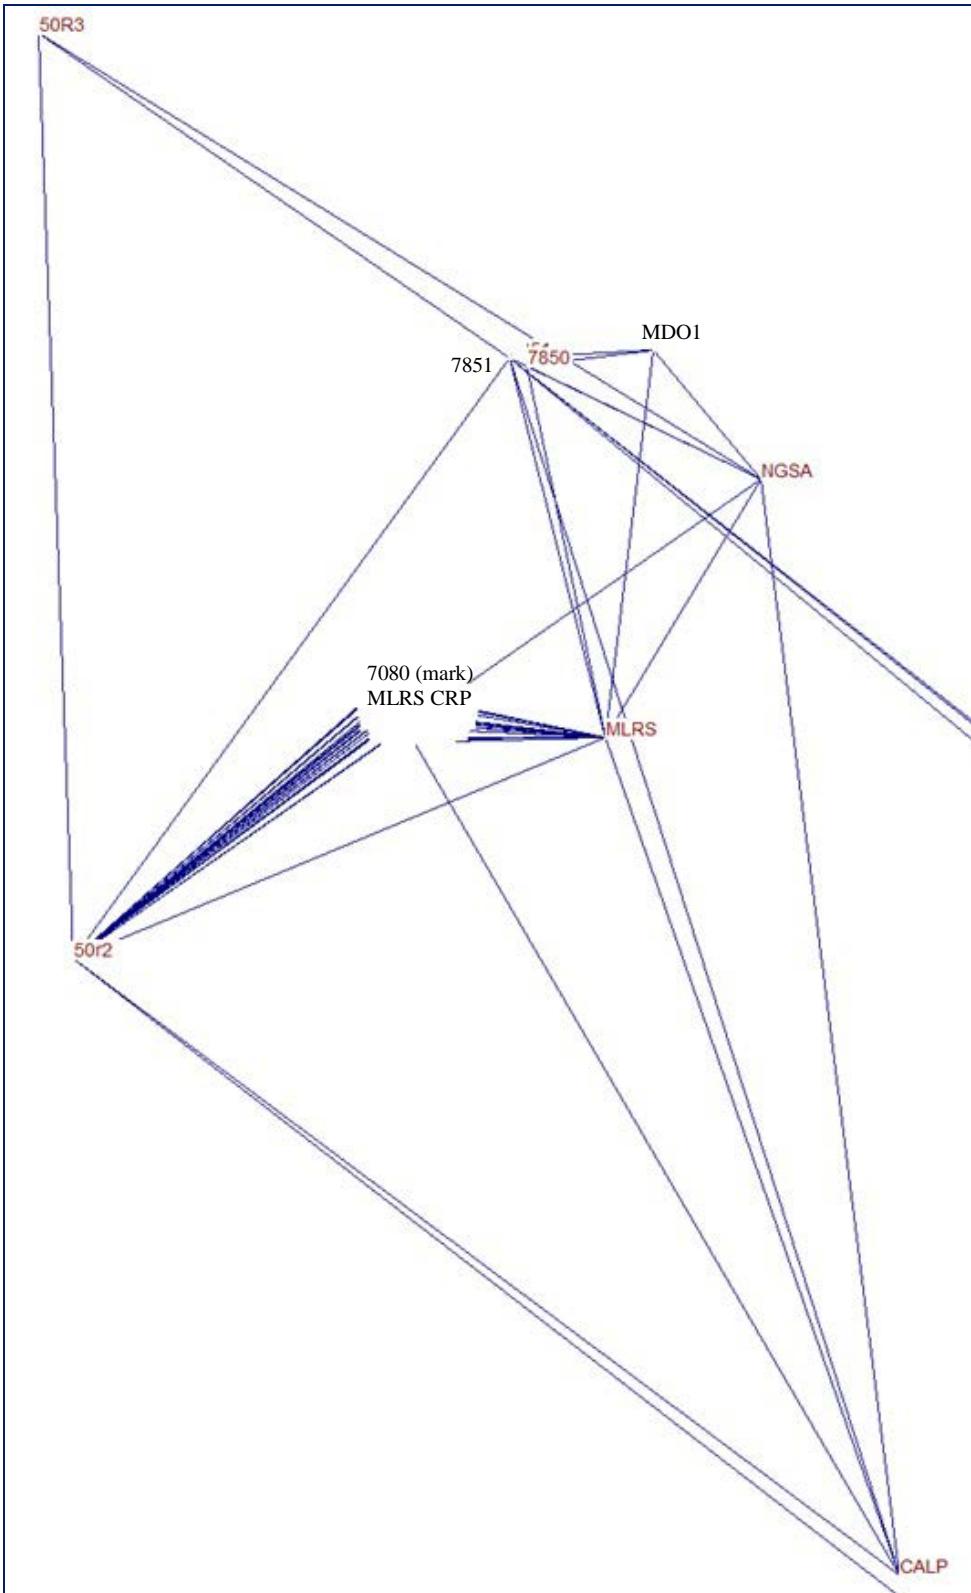

Figure 22: McDonald sub-network sketch. Ground network points 7850 RM 2 (50r2), 7851 and MLRS-TLRS (MLRS) were tied to the Fort Davis sub-network using GPS. MDO1 was not used in the tie because of uncertainties associated with its uncalibrated radome.

### Fort Davis Sub-network

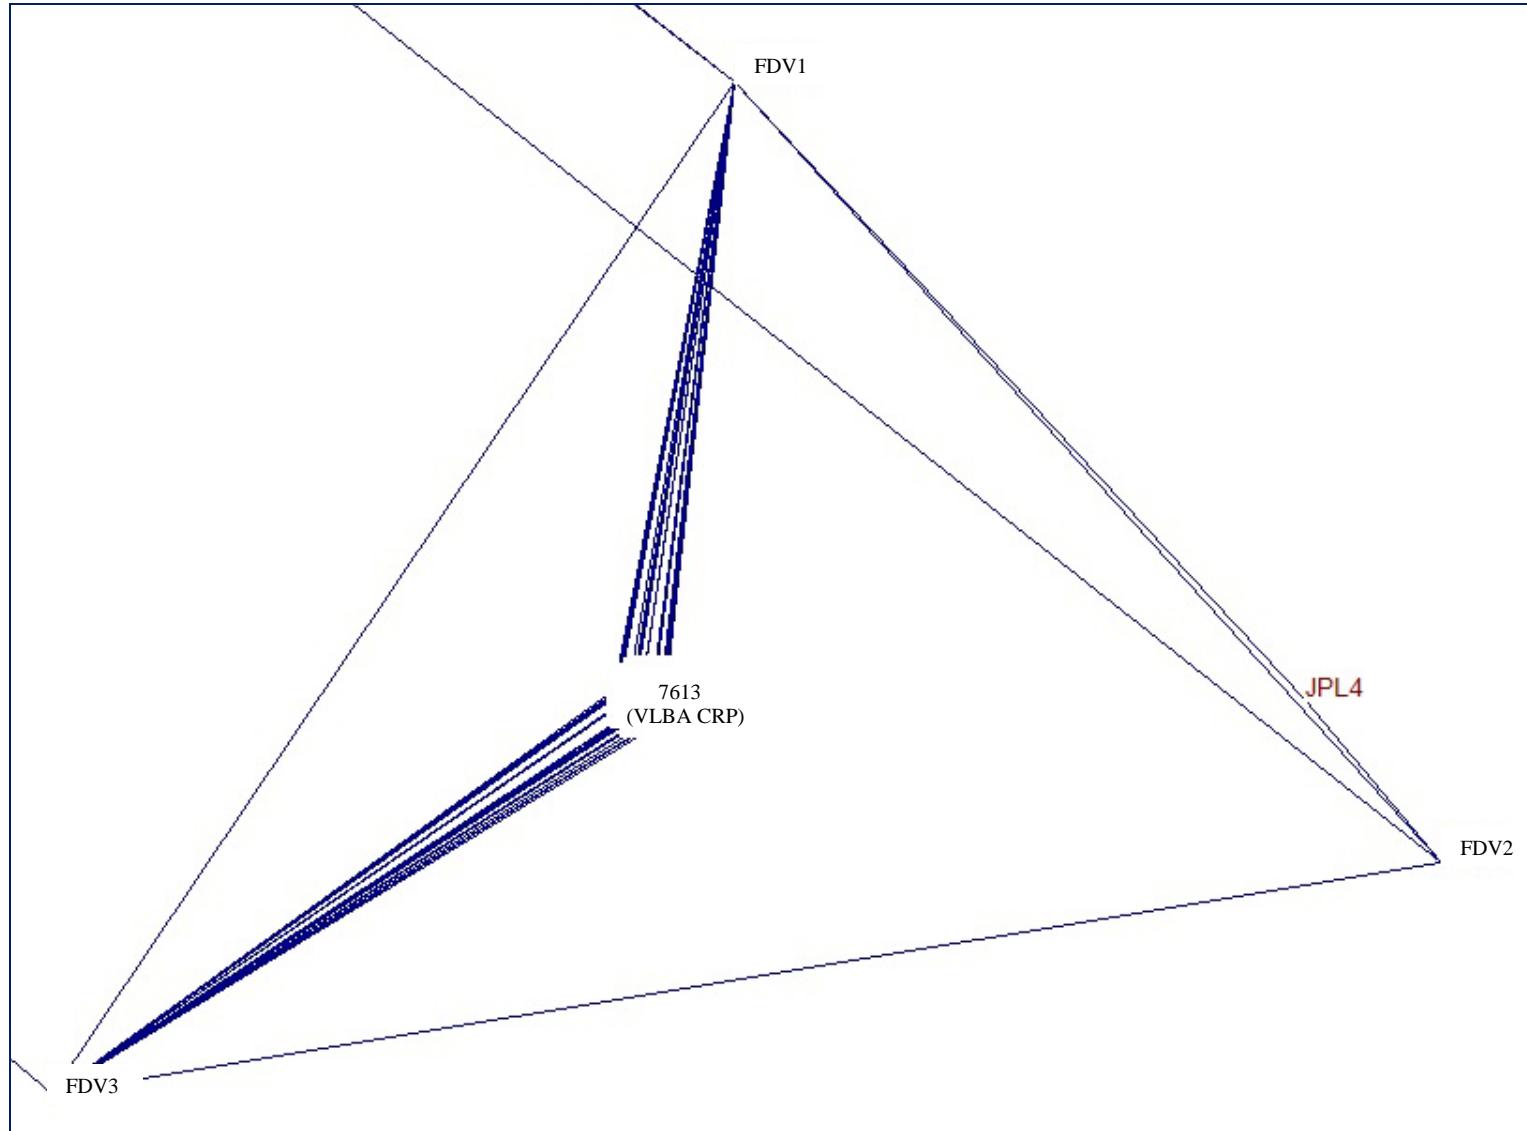

Figure 23: Ft. Davis sub-network sketch. FT DAVIS VLBA RMs 1, 2 and 3 (FDV1, FDV2 and FDV3, respectively), were tied to the McDonald sub-network using GPS.

### **3.2 Representation of Technique Reference Points**

The conventional reference point (CRP), a.k.a. invariant reference point (IVP), is a theoretical point and is defined as the intersection of the azimuth axis with the common perpendicular of the azimuth and elevation axis (Johnston et al, 2004).

#### **3.2.1 VLBI**

The National Radio Astronomy Observatory (NRAO) maintains the radio telescope, which has a 25-meter in diameter parabolic antenna on an az-el mount. An indirect approach was used to determine the CRP, a.k.a. 7613. This instrument does not have a reference mark.

**Figure 24: Ft. Davis VLBA**

### 3.2.2 SLR

NASA maintains the SLR instrument at the McDonald site. The instrument is a Coude telescope on an XY mount. The indirect approach to measuring the CRP was used. The reference mark for this instrument is 7080.

**Figure 23. SLR w/target bar mounted vertically to the telescope. Attached targets were positioned as they scribed circles about the y axis.**

The International Laser Ranging Service (ILRS) publishes site information for the the SLR operating at the McDonald Laser Ranging Station (MDOL) at  
[http://ilrs.gsfc.nasa.gov/network/stations/active/MDOL\\_sitelog.html](http://ilrs.gsfc.nasa.gov/network/stations/active/MDOL_sitelog.html)

Table 4 compares the offset values found in the site log to the results of the current survey. The site log values agree with previous survey information provided by Allied Signal Technical Services Corp.

Sources:	Current Survey (m)	ILRS Site Log (m)	Diff. (cm)
7080 to MCDONALD CORS MONUMENT (MDO1) (dX)	22.3961	+22.394	+0.2

**Table 4 – Offset comparison. Differences are listed in a new-minus-old format, where Diff. = Current Survey – IVS Offset.**

### 3.2.3 GPS

NASA maintains the GNSS antenna, which is centered over reference mark MCDONALD CORS MONUMENT (MDO1). For the site log, go to [ftp://igs.org/pub/station/log/mdo1\\_20130222.log](ftp://igs.org/pub/station/log/mdo1_20130222.log).

**Figure 24: AOA GPS choke ring antenna plumbed over MCDONALD CORS MONUMENT (MDO1). Pictured with radome removed for survey observations.**

MCDONALD CORS MONUMENT (MDO1) hosts an AOA choke ring antenna with an uncalibrated radome. At the time of the survey, the radome was removed to facilitate the survey and to allow for an eight-week radome-off data set to be collected and analyzed. Leveling observations included MDO1 (top of stainless steel plate).

Table 5 compares the offset values found in the site log to the results of the current survey. The site log values agree with previous survey information provided by Allied Signal Technical Services Corp.

### **3.2.4 DORIS (N/A)**

A DORIS instrument was not co-located at this site.

### **3.2.5 GLONASS (N/A)**

A dedicated GLONASS instrument was not co-located at this site.

## **4. Observations**

### **4.1 Conventional Survey**

A complete list of unadjusted and adjusted tacheometer field observations consisting of directions, zenith distances, slope distances, and instrument and target heights are available in FortDavis.lst compressed in a zip file under Fort Davis Data Products at <http://www.ngs.noaa.gov/corbin/iss/index.shtml>.

### **4.2 Leveling**

A NGS level line exists between McDonald Observatory and Fort Davis NRAO. Ties to this level line were made at this time to current ground network points at each sub-network according to first-order, class II specifications of the U.S. Federal Geodetic Control Subcommittee (FGCS).

The leveling at the McDonald Observatory began with the comparison of new height difference information between bench marks C 1097, VALIDATION RM 3, and P 1098. Analysis concluded that the original leveling to C 1097 was no longer valid. Additional leveling was conducted to include bench mark N 1098. From VALIDATION RM 3, leveling continued through the ground network's main scheme and supplemental points; 7850 RM 3, 7851, 7850, MCDONALD CORS MONUMENT (MDO1), MCDONALD VLBI STA CORS ARP, NGS A, MLRS-TLRS, CAL PIER 3, 7080, 7850 RM 2, and closing back on 7850 RM 3. The leveling between these ground network points adhered to FGCS first-order, class I specifications resulting in highly precise height differences. Leveling data was processed using the NGS program TRANSLEV 4.15. Leveling observational data file, McDonald.hgz, is found in the compressed (zip) file under Fort Davis Data Products at <http://www.ngs.noaa.gov/corbin/iss/index.shtml>.

The leveling at the Fort Davis NRAO began with the comparison of new height difference information between bench marks P 1097, Q 1097, and R 1097. Analysis concluded that the original leveling to R 1097 was no longer valid. Additional leveling was conducted to include bench mark N 1097. From Q 1097, leveling continued through the ground network's main scheme and supplemental points; FT DAVIS VLBA RM 3, FT DAVIS VLBA RM 1, JPL 4010 S, and closing back on FT DAVIS VLBA RM 3. The leveling between these ground network points adhered to FGCS first-order, class I specifications resulting in highly precise height differences. Leveling data was processed using the NGS program TRANSLEV 4.15. Leveling observational data file, FtDavis1.hgz, is found in the compressed (zip) file under Fort Davis Data Products at <http://www.ngs.noaa.gov/corbin/iss/index.shtml>.

## 4.3 GPS

GPS data were collected on six main-scheme points and retrieved from seven IGS tracking stations. A large amount of data was required to support the data analysis strategy described in Section 5.6 Discussion of Results. The tables below break down the GPS observation sets to provide information about how data was collected for specific purpose. Table 6 shows data collected to produce vectors that connected the two sub-networks.

Session (day of yr)	047	048	049	053	054	055	056	057	058	059
Minimum hours	22.0	22.0	17.0	12.0	3.0	21.0	15.0	20.5	24.0	17.5

## 4.4 General Comments

Data collection software GeoObs v1.04.02 was used for recording field measurements and for data quality checks.

Star\*Net least-squares software was used to analyze thousands of extremely precise tacheometer measurements to precision targets from the seven main-scheme ground network points. The result was a very tight, very clean network of marks based in a local coordinate system.

As noted earlier, determining the local coordinates of the SLR and radio telescope's CRP requires an indirect approach. The theory is straight-forward. A point, as it revolves about an axis, scribes a perfect arc. The arc defines a perfect circle and a plane simultaneously. The axis can

then be seen as it passes through the center of the circle, orthogonal to the plane. By assigning coordinates to the points observed along an arc rotated about an axis, one can assign parameters to the axis relative to an established local coordinate system. Tacheometer measurements project coordinates from the local ground network to the target attached to a telescope as it moves about the telescope axis, thereby providing the necessary information to locate a single axis. The same must be done for the opposing axis of the telescope in the same local coordinate system. The point along the primary axis that is orthogonal to the secondary axis is the conventional reference point of the telescope.

The minimum number of points needed to define a circle, and therefore an axis, is three. The minimum number of measurements needed to extend local coordinates to three points is ten (four horizontal directions, three vertical angles, and three slope distances). Twenty measurements will define two axes and provide local coordinates for the CRP.

In practice, a complex system of precise observations involving three targets secured to the telescope, measurements from two ground network marks, and at least 1,080 total measurements per axis ensure sub-millimeter results. At least 2,160 measurements are run through Star\*Net and into AXIS software to determine one CRP. CRPs for the VLBI instrument and two SLR instruments were determined in this manner

Another indirect approach, intersection, allows certain SGT instruments to continue uninterrupted operation while the tie to their reference mark is made. This approach was used on MCDONALD CORS MONUMENT (MDO1) and MCDONALD VLBI STA CORS ARP. The horizontal ties to these points were made by intersection from at least three ground network marks. At 7851, MLRS-TLRS, and NGS A, horizontal directions were observed to the left and right tangents of the symmetrically cylindrical pin used to center the choke ring antenna above MDO1. Tangent observations were later reduced to the center of the standoff (averaged), which is coincident to the gravity vector passing through MDO1. Heights for these MDO1 and the ARP were determined by differential leveling.

**horizontal direction.**  
**Each set of left and**  
**right tangent**  
**observations are**  
**averaged together in**  
**lieu of a single**  
**observation to the**  
**center.**

Differential leveling was also conducted through all ground network marks. Leveled height differences were used in conjunction with GPS-derived ellipsoid heights to learn more about the local geoid, and also check the quality of trigonometric leveling observations between network stations. The ability to compare trig leveling against a standard (differential leveling) while observing the SLR and radio telescope targets in the same local reference system provided quality assurance for those observations.

## 5. Data Analysis and Results

### 5.1 Terrestrial Survey

#### 5.1.1 Analysis software

A 3-D least squares adjustment was conducted on the terrestrial survey data using commercially available software Star\*Net version 7.2.2.7. The adjustment included leveled height differences. Results were reviewed for outliers in the survey observations and also used to verify the precision of the survey.

The 3-D adjustment consisted of terrestrial observations of all ground network marks, intersection stations, and intermediate target points on the SLR and radio telescope, producing local coordinates estimates for all. See <http://www.ngs.noaa.gov/corbin/iss/index.shtml> for terrestrial 3-D adjustment results found in the Star\*Net output file FortDavis.lst, located in a compressed file under “Fort Davis Data Products.”

AXIS Software, developed by Geoscience Australia (GA), was used to determine the SLR and radio telescope CRP. Coordinates for each target were computed during the 3-D adjustment, at each orientation of the radio telescope. These points were used to derive 3-D circles in space, which were used to determine axes parameters and subsequently, the CRPs. The following excerpt was taken from a GA site survey report and edited to reflect the particular circumstances of this survey. In the following excerpt, the term IVP is interchangeable with CRP.

The StarNet .dmp file, generated by the 3-D adjustment, included the full variance-covariance matrix required by AXIS. The .dmp file was placed into a directory with the AXIS software along with a setup. axs file. The setup file was edited repeatedly to derive estimates of circle parameters for each target and each rotation sequence. Once initial estimates were refined for all target rotation sequences, geometric constraints were added. Initial constraints introduced included:

CDIST – used to constrain target coordinates so that target-to-target distances remain constant over all rotational sequences. ;

ENORMAL, NNORMAL, UNORMAL – used to constrain normal parameters together;

CENTRE – used to constrain together centre to centre distances (azimuth axis only)

RADIUS – used to constrain circle arc radius parameters together

With updated circle parameter estimates for each target rotation sequence, IVP coordinates were derived. Additional constraints were introduced to constrain separate IVP realizations.

Constraints applied included:

OFFSET – used to constrain the computed offset to be identical for independent IVP estimates;

ORTHOG – used to constrain the orthogonality between three axes;

UIVP – used to constrain the individual IVP determination in the UP component together.

CRP computation results can be found at <http://www.ngs.noaa.gov/corbin/iss/index.shtml> in the AXIS file output. axs, Section 3.19 COMPUTED SOLUTION PARAMETER SUMMARY, located in a compressed file under “Fort Davis Data Products.”

### **5.1.2 Topocentric coordinates and covariance**

For topocentric coordinates and covariance information used in CRP computations, go to <http://www.ngs.noaa.gov/corbin/iss/index.shtml>, AXIS file output. axs, Section 2. INPUT SOLUTION.

### **5.1.3 Correlation matrix**

For computed correlation matrix information, see [Attachment B. SINEX File NGSFTDV1302GA.snx](#).

### **5.1.4 Reference temperature of radio telescope at Fort Davis NRAO [for thermal expansion]**

A height correction for the CRP of the Fort Davis VLBA was computed based on the following procedure:

- i) Compute a mean survey temperature and see to what extent it differs from the reference.
- ii) Multiply the CRP height by 0.000012 and by the temperature difference
- iii) Correct the CRP height if it is needed.
- **Telescope reference temperature:** +15.5 °C from Antenna Information File Format Version of 2008.04.22 found at <http://vlbi.geod.uni-bonn.de/Analysis/Thermal/antenna-info.txt>.
- **Estimated fixed axis temperature:** +11 °C (Estimate based on average actual air temperatures during tacheometer observations with a 1 hour delay to allow for heat gain/loss delays of the structure. No air temperatures were used in the computation that fell within 30 minutes of any daily high or low air temperatures.)
- **Estimated temperature difference** (reference - observed): +5 °C
- **Height of elevation axis, concrete foundation:** 0.5 m
  - Thermal coefficient of expansion: 1.0E-5 m/m °C  
See <http://vlbi.geod.uni-bonn.de/Analysis/Thermal/antenna-info.txt>
- **Height of elevation axis, fixed axis:** 13.7 m
  - Thermal coefficient of expansion: 1.2E-5 m/m °C  
See <http://vlbi.geod.uni-bonn.de/Analysis/Thermal/antenna-info.txt>

$$[500 \text{ mm} (1.0 \times 10^{-5} \text{ m/m } ^\circ\text{C}) + 13,700 \text{ mm} (1.2 \times 10^{-5} \text{ m/m } ^\circ\text{C})] \times (+5 \text{ } ^\circ\text{C}) = +0.8 \text{ mm}$$

The correction is provided for informational purposes and was not applied to the telescope.

## 5.2 GPS Observations

### 5.2.1 Analysis Software

NGS's beta version of Online Positioning User's Service (OPUS) Projects was used to post-process and analyze GPS data and to compute least-squares 3-D estimates of point positions.

OPUS Projects uses NGS's PAGE5 v1203.27 for post-processing. Default settings were used with two exceptions; 1) a hub was set up at each sub-network; 7851 at McDonald Observatory and FT DAVIS VLBA RM 1 at Fort Davis NRAO, and 2) the cutoff elevation for processing was lowered to 10°. The remaining default settings resulted in:

- the use of IGS08.atx absolute antenna calibration file.
- the use of IGS orbits (+/- 2 cm).
- the use of IGS08solution coordinate reference system with coordinates updated to date of observations using velocities.
- the use of default (modeled) meteorological values.
- the use of dual-frequency ionospheric correction.
- time parameters solved in data reduction.
- a double-difference, ionosphere-free (IF) combination solution, where

$$IF = \{f_{21}/(f_{21} - f_{22})\}L_1 - \{f_1 f_{21}/(f_{21} - f_{22})\}L_2$$

- not all integer biases being determinable, further resulting in partial, fixed integer estimate of biases.

Intended accuracy of vectors is 0.1 ppm plus 0.5 cm (FCGS A-order). All base lines were measured at least twice, once on each of two days. Redundant vectors were checked against each other to ensure precision.

OPUS Projects uses the program GPSCOM v1203.15, a simple Helmert Blocking normal equation processor which combines multiple GPS data sets that have initially been processed by the program PAGES, to form and partially reduce normal equations eliminating numerous nuisance parameters which are not generally of interest in a large global adjustment. The normal equation elements for the global parameters, those to be passed on to a combined adjustment, are written by PAGES into a normal equation file which becomes the basic input data for the program GPSCOM. One or more of these files as well as its own output normal equation files can then be processed by GPSCOM to provide a combined adjustment of the global parameters. This program was written in FORTRAN. Predominantly ANSI standard FORTRAN, a few isolated routines query the operating system for time and date, user and system identification. These "system" routines are inherently non-portable but, should be easily modified or disabled. For more information, go to <http://www.ngs.noaa.gov/GRD/GPS/DOC/gpscom/gpscom.html>

In the end, all data were processed in a single OPUS-Projects solution with the coordinates of the seven tracking stations constrained. To combine the two sub-networks into one, vectors from four base lines between the sub-networks were extracted and added to the combined terrestrial observation set and run through Star\*Net.

<u># of vectors</u>	<u>McDonald Observatory</u>	<u>Fort Davis NRAO</u>
8	7851	—
3	7851	—
9	7851	—
5	7850 RM 2	—
		FT DAVIS VLBA RM 1
		FT DAVIS VLBA RM 2
		FT DAVIS VLBA RM 3
		FT DAVIS VLBA RM 1

The coordinates for the tracking stations been extracted from the ITRF website, <http://itrf.ensg.ign.fr/>, in ITRF2008 (epoch date of survey). All points are correlated as seen in [Attachment A. GPS Geocentric Coordinates and Covariances](#). The result was ITRF2008 coordinates for the current survey epoch date for the six ground network points. Position solutions for all six main-scheme ground network points were used in a single transformation of the entire project.

## 5.2.2 Results

Table 9 summarizes redundant GPS vectors and shows how well the repeated measurements agree. In the final adjustment, all vectors were reprocessed and weighted based on OPUS-Projects' estimate of quality.

**Table 9: Redundant vectors compared well with each other. OPUS-Projects weighted estimates used in the final adjustment based on vector quality.**

The final GPS coordinates were computed independently using NGS's OPUS-Projects web-based software. See [Attachment A. GPS Geocentric Coordinates and Covariances](#) for the OPUS Projects output SINEX file. AXIS output Section 5 Frame Alignment, (<http://www.ngs.noaa.gov/corbin/iss/index.shtml>), reflects a high level of precision between the GPS and terrestrial surveys.

## 5.3 Additional Parameters

In addition to the CRPs, AXIS software computed an azimuthal/elevation axes offset value for the two telescopes included in the current survey. The offsets can be found in Section 3.7 of the AXIS output file available at <http://www.ngs.noaa.gov/corbin/iss/index.shtml> and are provided in Table 10.

The International VLBI Service (IVS) reports the length of the axis offset to be **2.1324meters** (A. Nothnagel, 2009), a change of -2.6 mm.

CRP for:	Offset Provided by Service (m)	Offset from current survey (m)	Difference (mm)
7613 (Fort Davis VLBA)	+2.1324	+2.1298 ±0.0029	-2.6
McDonald LR Station	N/A	+0.0758 ±0.0009	N/A

Table 10: Telescope Axes Offsets.

## 5.4 Transformation

The GPS data collected on marks near the four corners of the project were used for transformation from a local reference frame to ITRF2008(epoch date of survey). NGS's OPUS-Projects GNSS processing and adjustment utility produced geocentric coordinates propagated to ITRF2008 (epoch date of survey). The integrity of the terrestrial survey is maintained throughout the transformation process.

The following is the AXIS summary of the transformation:

TRANSFORMATION PARAMETERS: ARBITRARY TO GLOBAL (OR REFERENCE SET)						
CARTESIAN SYSTEM	: CENTROID ORIGIN					
VARIANCE FACTOR	: 4.71596e-07					
SIGMA	: 6.86729e-04					
TX	TY	TZ	RX	RY	RZ	
M	M	M	AS	AS	AS	
-0.0007	-0.0001	-0.0009	-5.61	3.45	4.18	

Table 11: AXIS Transformation Summary. T represents translation in meters and R is rotation in arc-seconds.

## 5.5 Description of SINEX generation

The SINEX file was directly generated by AXIS. For details, see AXIS output file, output.axs, Section 6.1 USER INPUT SINEX INFORMATION at <http://www.ngs.noaa.gov/corbin/iss/index.shtml>. The following SINEX naming convention, adopted by GSA for local survey data, was also used for this survey.

**XXXNNNNYYMMFV.SNX**

Where:

**XXX** is a three-character organization designation

**NNNN** is a four-character site designation

**YY** is the year of the survey

**MM** is the month of the survey

**F** is the frame code (G for global, L for local)

**V** is the file version

See [Attachment B. for SINEX file NGSFTDV1302GA.SNX](#).

A concerted effort was made to tie to all points at the site that currently have DOMES numbers, along with the CRPs of the two SGT instruments. The following seven points are included in the SINEX file.

Code	DOMES#	Description	Longitude	Latitude	Ht.
7080	40442M006	MLRS mark 7080 1988	-104 00 54.7	30 40 49.0	2004.3
7850	40442M008	Mobile VLBI/SLR mark	-104 00 54.3	30 40 49.8	2004.2
7851	40442M011	SLR MARK 7851	-104 00 54.4	30 40 49.8	2004.2

**Table 12: SINEX File Listing. Includes any/all surveyed points with DOMES numbers and/or SGT instrument CRPs.**

## 5.6 Discussion of Results

Because the two sub-networks (McDonald Observatory and Fort Davis NRAO) were 8 km apart, a good geoid model and deflection-of-the-vertical model were essential to align the sub-networks into the same reference frame. NGS's Geoid12A and Deflec12A models were used to accomplish this. During this survey, steps were taken to validate these models. For the geoid model, geodetic leveling results were compared against GPS-derived orthometric heights. See Table 13 for results.

Ground Network Points	Adjusted Diff. Leveling Orthometric Hts.	Adjusted GPS-derived Orthometric Hts.	Difference (cm)
7851 (constrained)	2026.555	2026.555	0.0
MCDONALD CORS MONUMENT	2026.818	2026.817	-0.1
7850 RM 2	2023.939	2023.938	-0.1
MLRS TLRS	2027.039	2027.039	0.0
FT DAVIS VLBA RM 1	1609.616	1609.612	-0.4
FT DAVIS VLBA RM 2	1619.197	1619.192	-0.5
FT DAVIS VLBA RM 3	1613.901	1613.900	-0.1

Table 13: GPS heights using Geoid12A hybrid geoid model compared favorably to leveled heights.

For deflection values, the results from two different methods of deriving ITRF coordinates from topocentric measurements were compared against each other. Both methods used results from a single GPS network solution in slightly different ways. In Method #1, the two sub-networks were adjusted separately using coordinates from the single GPS solution for the purpose of transforming from their local reference frames into ITRF2008 (epoch date of survey). No geoid or deflection values were needed or used. Method #2 combined the two sub-networks using vectors from the GPS solution in a single geodetic adjustment. This adjustment required geoid and deflection values. Coordinates from the GPS network solution were used to transform to ITRF2008 (epoch date of survey). See Table 14 for comparison of the results of the two methods.

Ground Network Points	Results from Method #1			Results from Method #2			Diff. Geocentric (mm)	Diff. Topocentric (mm)

Table 14: Positional differences show DEFLEC12A performed well in correcting for vertical deflections.

Method #2 and the following least-squares strategies were used to produce the final SINEX data.

### Least-Squares Estimates of Terrestrial Observations

A minimally constrained, 3-D adjustment of tacheometer observations was run in ITRF2008 (epoch date of survey) using Star\*Net 7.2.2.7. GPS-derived 3-D coordinates for two ground control network points were loosely constrained, along with GPS-derived azimuths to provide orientation. 7851 was selected at the McDonald Observatory sub-network with an azimuth to MLRS-TLRS. At the Fort Davis NRAO, FT DAVIS VLBA RM 1 was chosen with an azimuth to FT DAVIS VLBA RM 3. Leveled height differences between all ground network points at each sub-network were weighted heavily. Zenith distance observations between ground network points were unconstrained. As a matter of practice, observations to each target consisting of one direct and one reverse (face I and face II) were repeated at least three times. The direct and reverse observations were averaged together in the data collection software to produce a single repetition. All repetitions were evaluated individually in the least-squares adjustment output.

- The residuals of the distances, zenith distances and directions were highly consistent among the vast majority of points; “fringe” values were not rejected, but simply assigned an appropriately higher standard error estimate instead.
- Star\*Net reports the sum squares of standard residuals is 1335.191 with a total error factor of 0.985, passing the Chi-square test at 5 % level.

For additional details, see the Star\*Net output file FortDavis.lst at  
<http://www.ngs.noaa.gov/corbin/iss/index.shtml>, found in a compressed “zip” file under Fort Davis Data Products.

### Least-Squares Estimates of Conventional Reference Points

AXIS solved for two SGT instrument CRPs using position and variance-covariance estimates from Star\*Net. AXIS reports the following solution statistics:

3.2 SOLUTION STATISTICS

Table 17: Vector information from current survey in ITRF2008 (epoch date of survey).

#### Local Vector Comparisons: Survey-derived Versus IERS-derived

Table 18 contains the topocentric vectors derived from the current survey compared against those vectors derived from coordinates extracted from the IERS ITRS Product Center web site (see [Attachment C. IERS ITRS Product Center SINEX File](#)). The Product Center provided coordinates in ITRF2008, propagated to the epoch date of the current survey. NGS's program INVERS3D ([http://www.ngs.noaa.gov/PC\\_PROD/Inv\\_Fwd/](http://www.ngs.noaa.gov/PC_PROD/Inv_Fwd/)) was then used to derive the local vectors. The comparisons suggest discrepancies greater than 5 mm to all three points, most notably 7080, the reference mark for the McDonald LRS. It might be worth noting that the MDO1 position determined from the GPS data analysis (as the IERS uses, from the IGS) could be affected by the normal presence of an uncalibrated radome. That could affect all the vector comparisons in the table to some extent.

<b>From</b>	MDO1, MCDONALD CORS MONUMENT DOMES #40442M012	<b>IERS-derived</b>	<b>Current Survey</b>	<b>Diff. (mm)</b>	<b>IERS Reported Discrepancy* (mm)</b>

Table 18: Topocentric Vector Comparisons. Differences are listed in a new-minus-old format, where Diff. = Current Survey – IERS-published. For an additional comparison, the last column shows the discrepancy currently recognized by the ITRS, where Residual = Space Geodesy – Terrestrial Tie.

\*[http://itrf.ensg.ign.fr/ITRF\\_solutions/2008/doc/ITRF2008-Tie-Residuals.dat](http://itrf.ensg.ign.fr/ITRF_solutions/2008/doc/ITRF2008-Tie-Residuals.dat).

## 5.7 Comparison with Previous Surveys

Allied Signal Technical Services (ASTS, currently Honeywell Technology Solutions, Inc.), provided output files from two least-squares adjustments that used data from previous surveys dating as far back as 1979. One adjustment compiled older observations made by both ASTS and the NGS into a single network. The other adjustment contains more recent observations made by ASTS between old ground network points to newer points set in support of 7613, the CRP of the VLBA. It is rather unfortunate that no currently recoverable points are common to both data sets, causing the comparison to the current survey to be presented in two tables. All vectors emanate from the MDO1, MCDONALD CORS MONUMENT.

<b>From</b>	MDO1, MCDONALD CORS MONUMENT DOMES #40442M012	<b>ASTS-Provided Vector Data</b>	<b>Current Survey</b>	<b>Diff. (cm)</b>

**Table 20:** Differences between results of the current survey and data provided by Allied Signal Technical Services compare favorably. Vectors emanate from the CRP of the radio telescope at Fort Davis NRAO. Diff. = current survey minus ASTS-provided data.

## 6. Planning Aspects

Establish a point-of-contact (POC) at McDonald Observatory and Fort Davis NRAO to coordinate access to the site and schedule time on the SLR and VLBA instruments.

At the time of the current survey, the onsite POC at the McDonald Observatory was:

Mr. Jerry Wiant  
McDonald Observatory  
House 9  
Highway 118  
Fort Davis, TX 79734  
Phone 432-426-3668  
Fax 432-426-3803  
Email [jrw@astro.as.utexas.edu](mailto:jrw@astro.as.utexas.edu)

At the time of the current survey, the onsite POC at the Fort Davis NRAO was:

Mr. Jason Candelara  
NRAO Fort Davis VLBA Station  
PO Box 2008  
Fort Davis, TX 79734  
Phone 915-426-3517  
Email [jcandela@nrao.edu](mailto:jcandela@nrao.edu)

### Recommendations:

- Do not remove radome at MDO1, MCDONALD CORS MONUMENT, without permission from the IGS Tracking Station Responsible Agency Primary Contact. Contact information is provided in the IGS Tracking Station Site Log for station MDO1undre Section 12 at [http://igscb.jpl.nasa.gov/igscb/station/log/mdo1\\_20130222.log](http://igscb.jpl.nasa.gov/igscb/station/log/mdo1_20130222.log). The responsible agency at the time of the current survey was the Jet Propulsion Laboratory. The primary contact at the time of the survey was David Stowers, Jet Propulsion Laboratory/Caltech, Product Delivery Manager, Global Observing System – GNSS, Tracking Systems and Applications Section - 3350

4800 Oak Grove Drive, M/S 238-600, Pasadena, CA, USA

Tel. +1 818-354-7055, fax +1 818-393-4965, E-mail [dstowers@jpl.nasa.gov](mailto:dstowers@jpl.nasa.gov)

- Coordinate in advance with the on-site technicians to take advantage of radio telescope maintenance down time. Site personnel drives the radio telescope under survey team direction during observations.
- Suggestions for optimizing surveying conditions:
  - Plan measurements over longer lines to be observed earlier in the day to mitigate heat shimmer on targets.
  - Consideration should be given to installing wooden observing stands.
  - The SLR's electronics are very sensitive to precipitation and must be completely enclosed in advance of inclement weather. Also, it can be deemed too windy to open the cover on the telescope. Consult with operator to schedule access to instrument.
