SP3c data evaluation

- L51/L52/L53/L54 SP3c files available at CDDIS and EDC – march 2013
- cross-evaluate their consistency (RAC)
- Try a preliminary combination among the more coherent ones

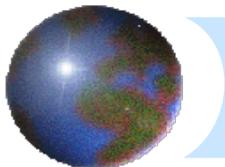

Product Features

- EF frame tied to SLRF2008
- UTC
- SP3c format
- 2' POS/VEL L51/L52
- 15' POS/VEL L53/L54

SP3c files - remarks

- L51/L52 asi, bkg, dgfi, gfz, jcet, nsgf
- L53/L54 asi, bkg, dgfi, jcet, nsgf
- Format check
 - nok esa: L53/L54 5'
- asi, bkg, gfz, nsgf coherent ($\sim 2-4\text{cm}$ C-A L51/L52)
- dgfi shows discrepancies in A component
- *jcet shows big differences in C component*
- Evident differences in the dynamic modelling
- Test combination for L51 using asi, bkg, gfz, nsgf

L51 NSGF-ASI-BKG-GFZ vs Combination

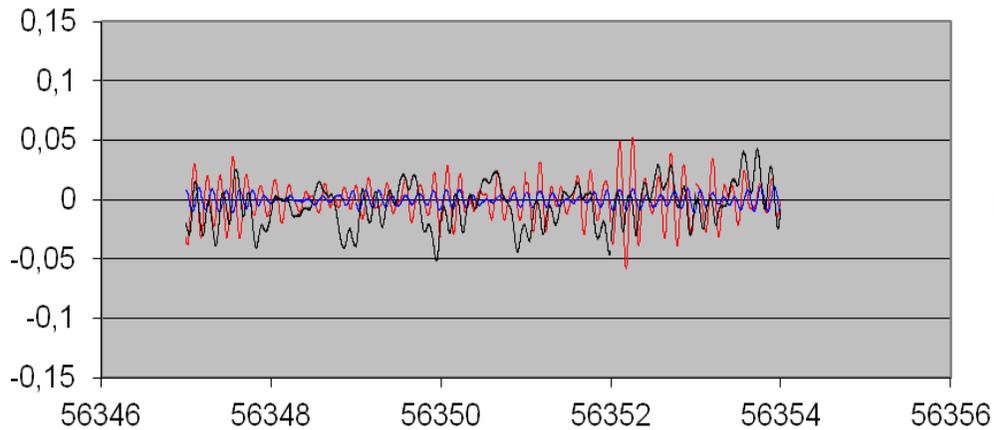

ASI-C

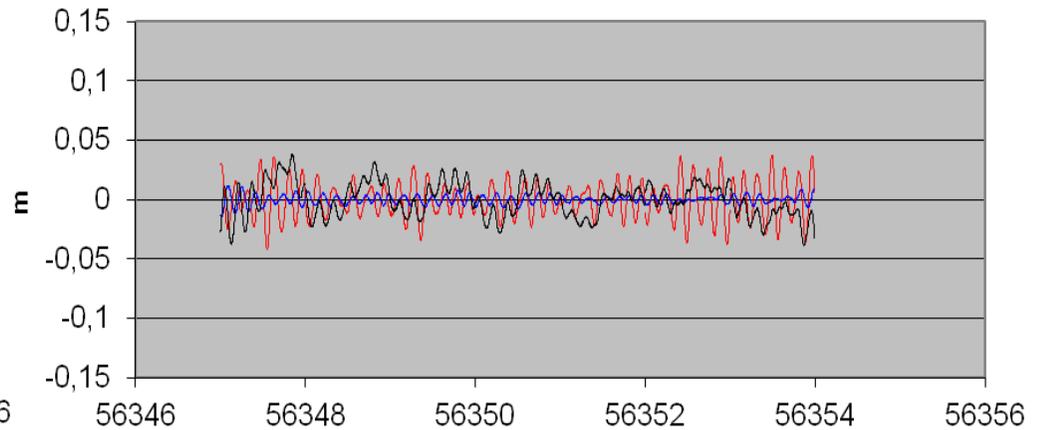

BKG-C

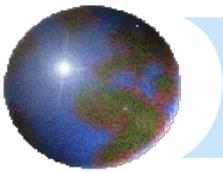

GFZ-C

NSGF-C

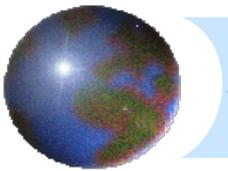

L51 NSGF-ASI-BKG-GFZ vs Combination

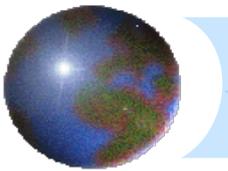

ASI - C cm	R	+0.04 ± 0.38
	C	+0.06 ± 2.42
	A	+0.20 ± 2.10
GFZ - C cm	R	-0.02 ± 0.47
	C	-0.04 ± 1.61
	A	-0.52 ± 1.77

BKG - C cm	R	-0.01 ± 0.34
	C	+0.01 ± 1.70
	A	+0.35 ± 1.71
NSGF - C cm	R	-0.01 ± 0.37
	C	-0.02 ± 1.57
	A	-0.02 ± 1.46

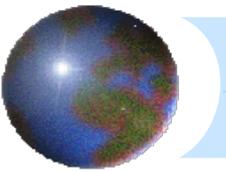

Combination evaluation, weighting, etc.

- As a first step, the combination has been computed as a simple mean of the contributing solutions SVs
- We can associate to each series a formal error given by the 3D discrepancy wrt combination (RSS of the R, C, A residuals RMS)
 - **ASI: 3.23 cm**
 - **GFZ: 2.49 cm**
 - **BKG: 2.46 cm**
 - **NSGF: 2.18 cm**
- and we can associate to the combination the formal error propagating the contributing solutions formal error
 - **C: 1.26 cm**

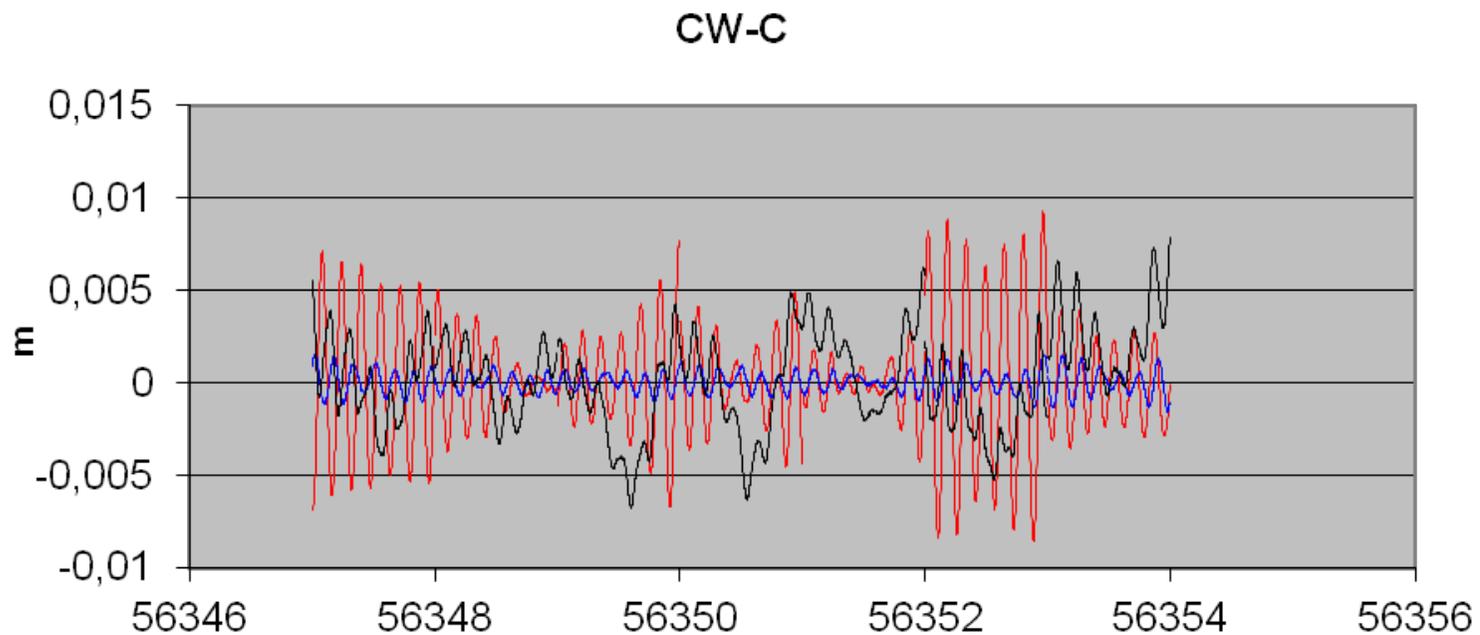

Combination evaluation, weighting, etc.

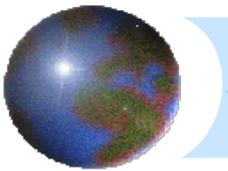

- As a second step, we can compute a combination C' as a weighted mean of the contributing solutions SVs, using as weights $w_i = 1/\sigma_i^2 / \Sigma(1/\sigma^2)$
- In that case, the 3D discrepancies wrt combination (RSS of the R, C, A residuals RMS) are
 - **ASI: 3.63 cm**
 - **GFZ: 2.35 cm**
 - **BKG: 2.39 cm**
 - **NSGF: 1.95 cm**
- and the propagated formal error
 - **C: 1.20 cm**

Combination evaluation, weighting, etc.

- i.e., as expected, the combination 'awards' the best solutions (the closer ones), even if the overall benefit appears to be small

Next steps

- Start on 2014.0 the routinary production (not public) of the combined orbit files for L51 and L52, using gfz, bkg, asi, and nsgf 'bulk' solutions (all 4 solutions available?)
- Apply a 2-step combination scheme, deriving weights
- Evaluate the quality and stability of this 'pilot' solution for a couple of months, deriving corrective actions, in particular to remove periodic signals evident in the series
- Integrate the other solutions when available, using the weighted combination and the outcomes of the evaluation of the 'bulk' combination

Update of the ILRS Data handling file and SLRF2008

Report DGFI AC

ILRS Analysis Working Group Meeting
Fujiyoshida, Japan, Nov. 9, 2013

Horst Müller

Deutsches Geodätisches Forschungsinstitut (DGFI)
Centrum für Geodätische Erdsystemforschung (CGE)
München

email: mueller@dgfi.badw.de

Products

- Delivered regularly daily v130
 - Problems with new stations (DGFI is not solving for biases, follows rules given in the data handling file), some other AC solve for biases
 - Editing of observation is differs to other centers, eventually harmonization or comparison of data editing, or at least edit criteria. For stations with only few observations this has big influence on the coordinates solved.
- Weekly products v35
 - Lageos and Etalon orbits for version v35 delivered in sp3 format, along track problem not yet solved.
- DOGS status
 - current version 5.2 includes non tidal atmospheric loading and station dep. CoM as standard.
 - DOGS-OC 5.2 follows IERS 2010 conventions,
 - Products use eigen6c2 gravity field and FES2004 ocean tides, estimation of low-degree SH of the gravity field is possible

Biases

Biases are critical especially for stations with poor station coordinates

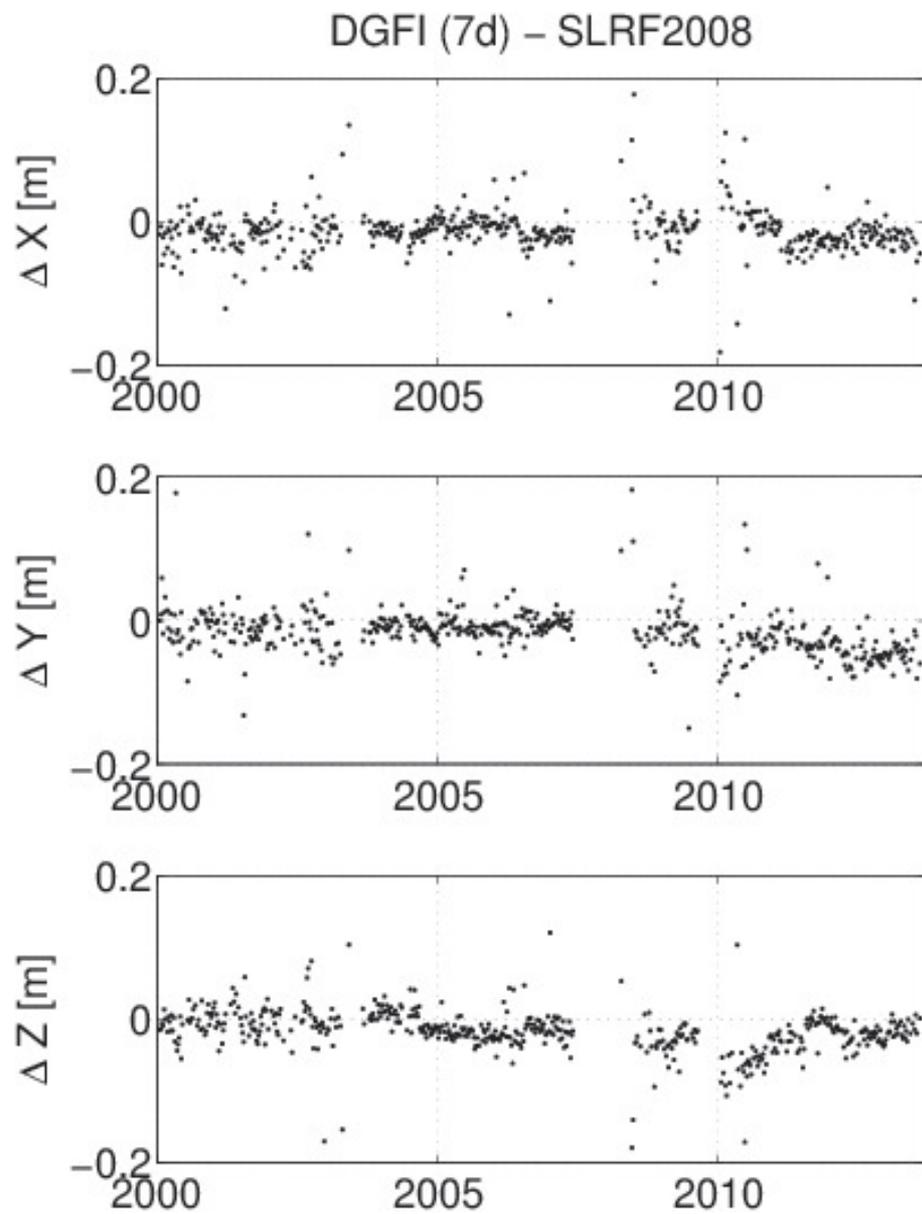

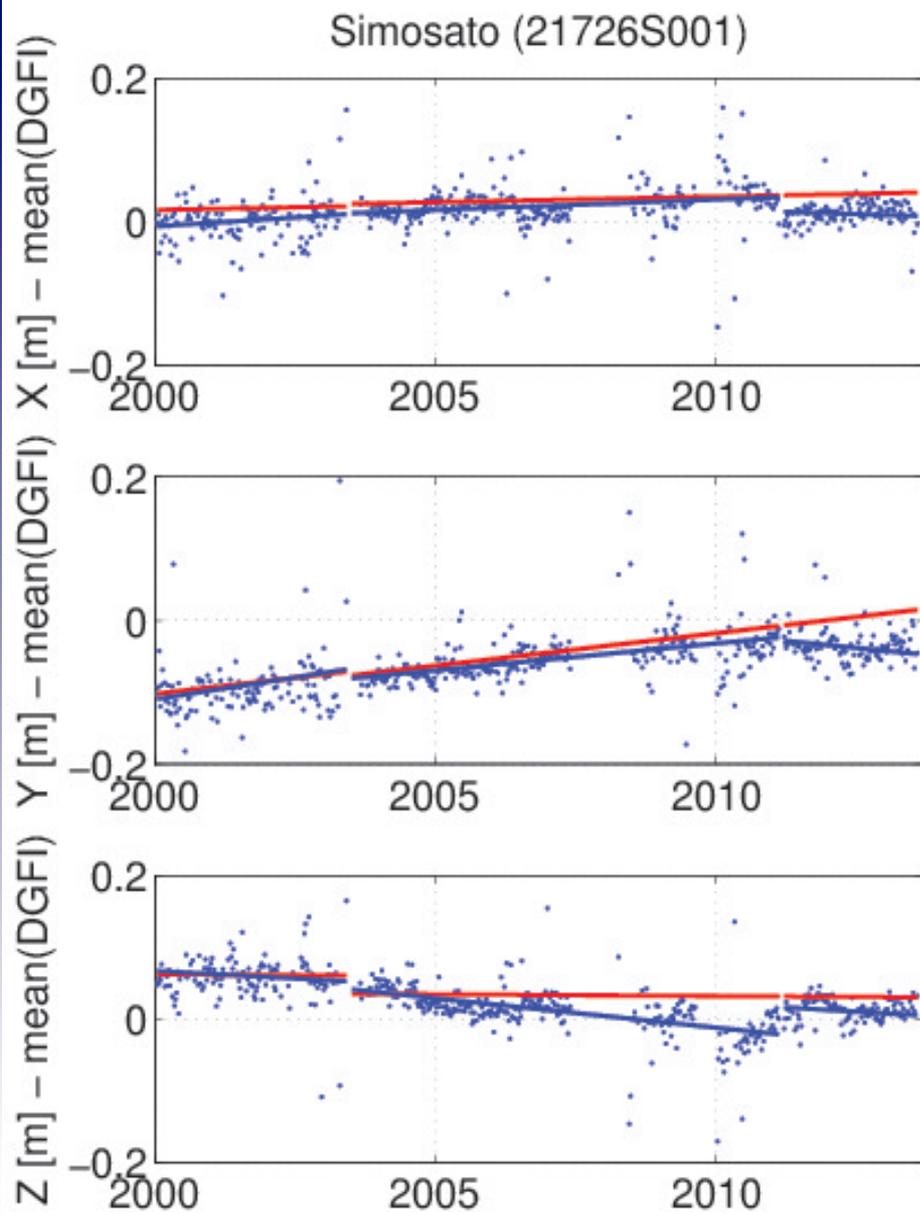

The problem with can only be solved if all ACs use the same set bias parameters *and* the station coordinates are good enough. For a number of stations, either new or in tectonic regions, SLRF2008 needs an update.

For harmonization all ACs should follow rules defined by the data handling file.

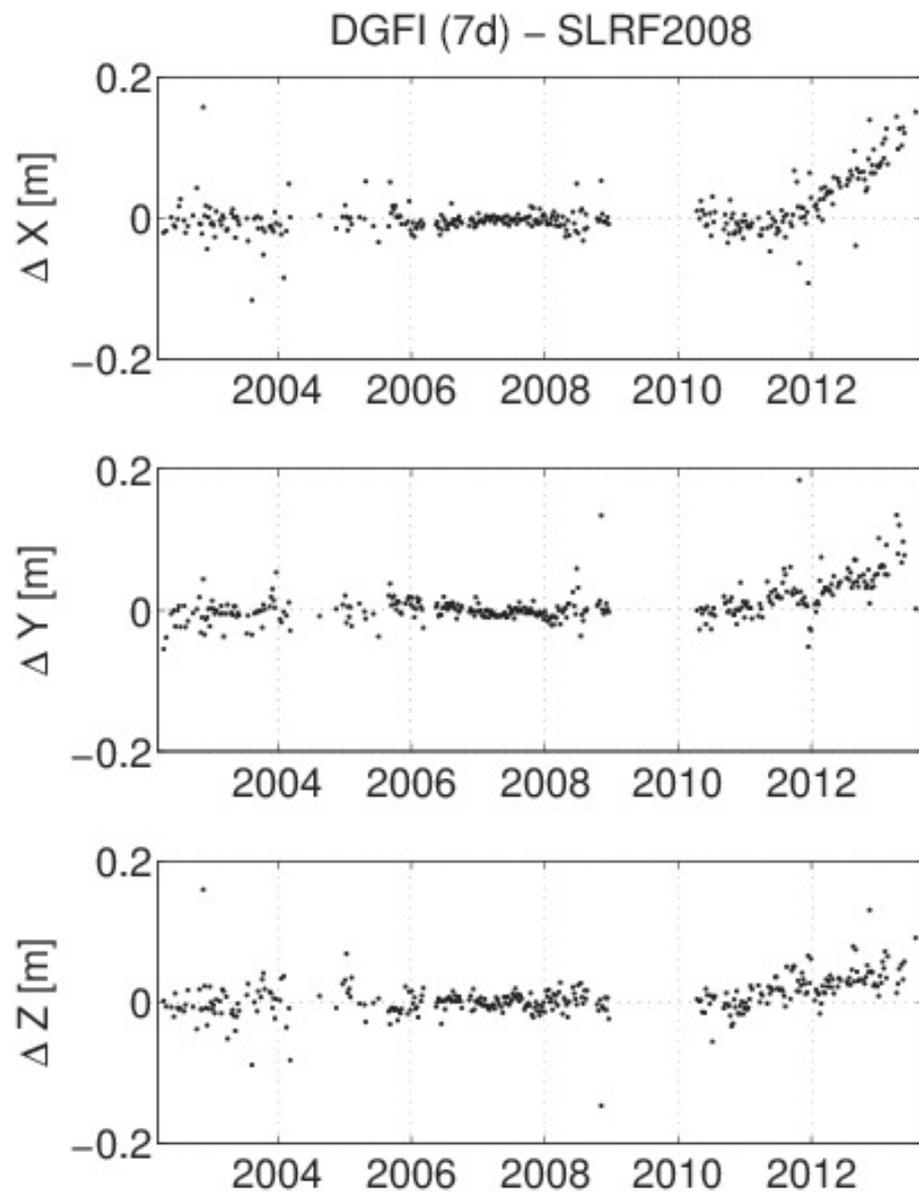

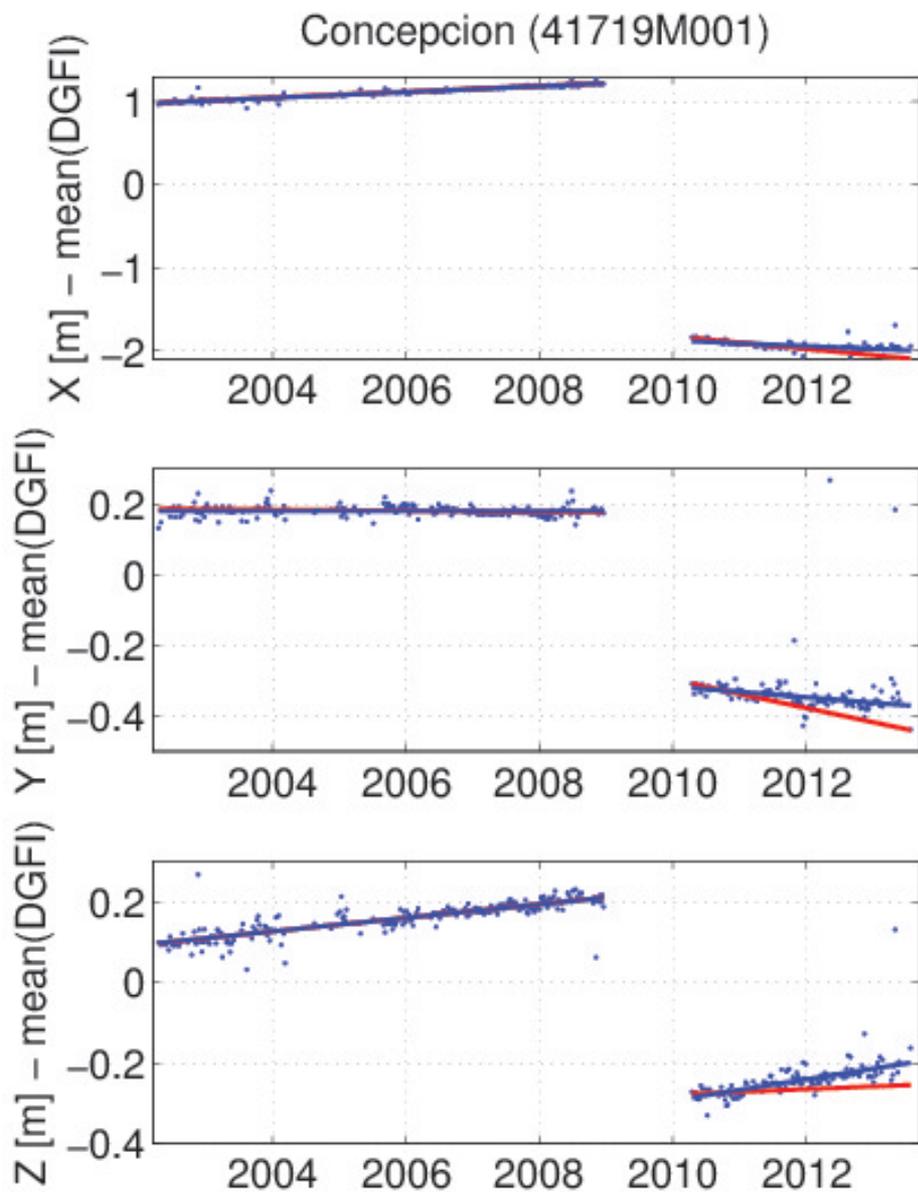

A new bias parameters as used for the combined solution, and for the ITRF2008 computaion, should be estimated with good coordinates (common bias for Lageos1 and Lageos2 ?) New set of bias parameters were delivered by Cinzia. These updates are not yet implemented, needs approval at AWG meeting.

New set of station coordinates delivered by Mathis Blossfeld, DGFI. Good improvement for a few stations.

ILRS Data Handling File

The ILRS data handling file maintained at DGFI should be mandatory for all ACs, to have a homogenous product. But the files need some updates and addenda.

- New flag **Q** for stations in quarantine
- New flag **N** for „not reliable“ stations, like Simeiz (1873) or San Juan (7406), which should not be used for standard products but can be used for other analysis
- New flag **P** for stations with only preliminary coordinates, for these stations it is not recommended to solve for biases and they should not be used in the official products until a coordinate update is possible.

At the moment San Juan, Simeiz seem to have problems with the data they deliver and should not be used. New stations Kunming and Daedok are now in Quarantine, like Wettzell and Greenbelt.

The bias values listed in the file need a revision for the ILRS contribution to ITRF2013..

Lares

Lares, launched Feb. 2012 is a good target to improve the quality of the ILRS products

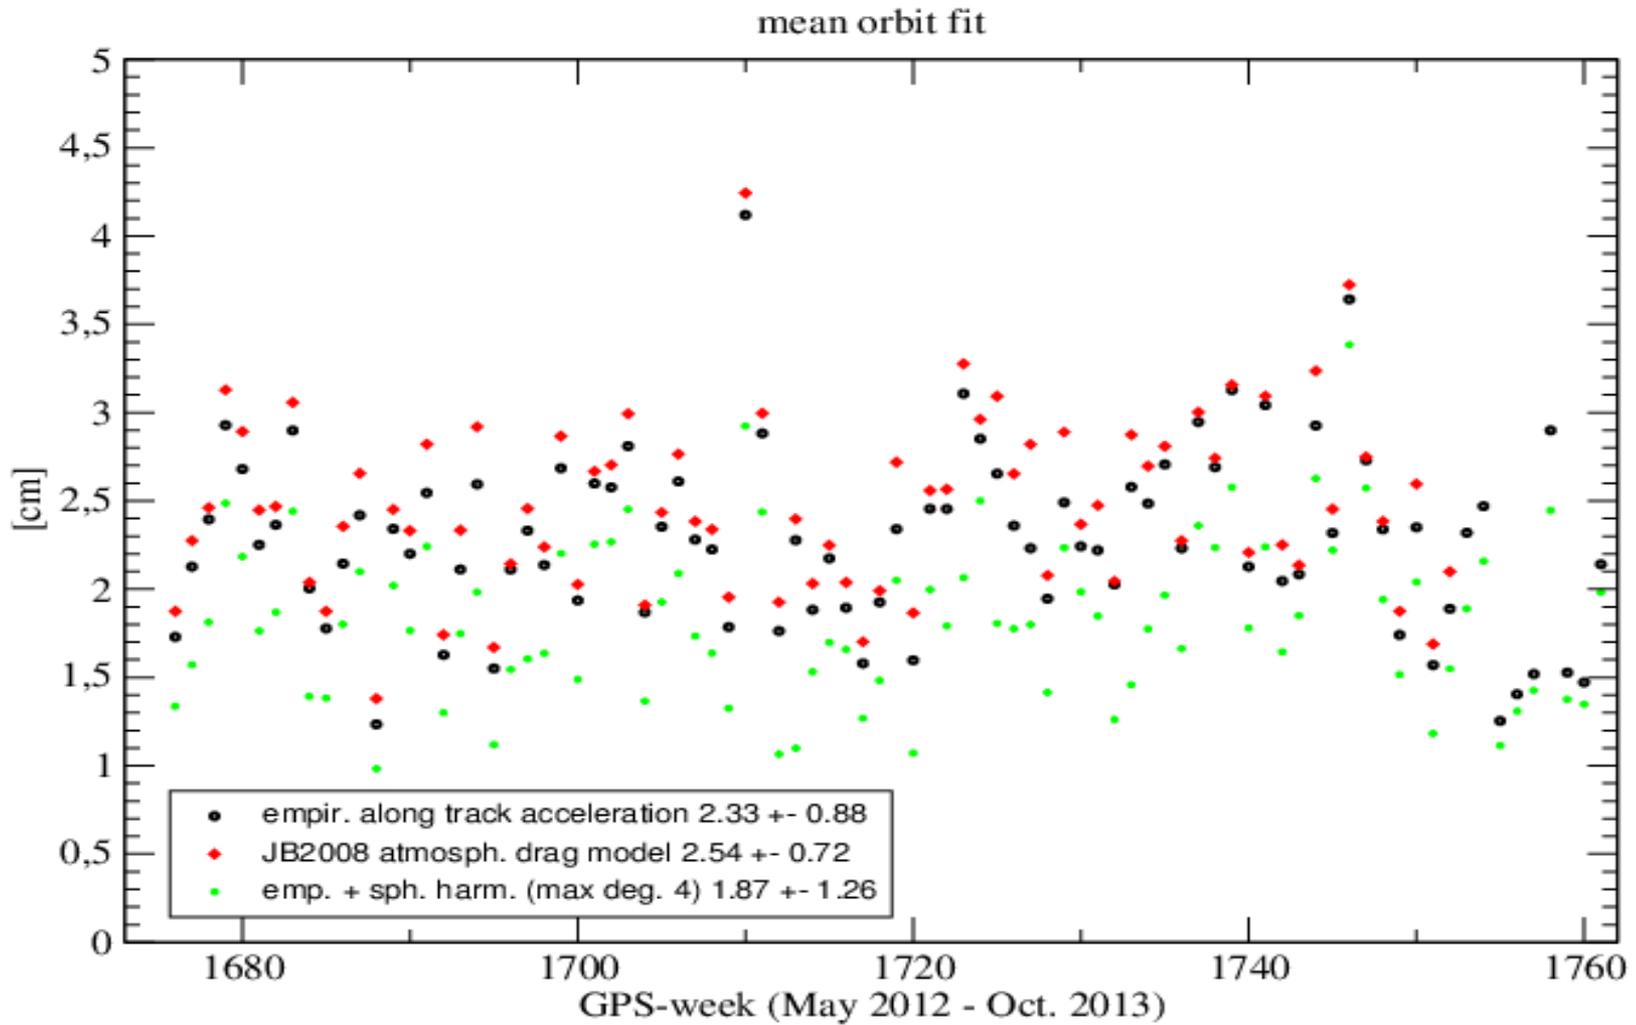

- Heavy satellite > small a/m value
- No need to model drag force of the high atmosphere, simple empirical force is sufficient
- Low enough to solve for low degree harmonics
- Good number of observation, mean 1750 per week, sometime > 2000, and more than Lageos1
- Good orbital fit ~ 2.5 cm without solving for spherical harmonic coefficients (see graph)

Etalon1/2 have a decreasing number of observations ~200 Etalon1 and ~150 Etalon2 presently. Sometimes < 100 observations/week. This does not allow a good and reliable orbit computation. (see graph)

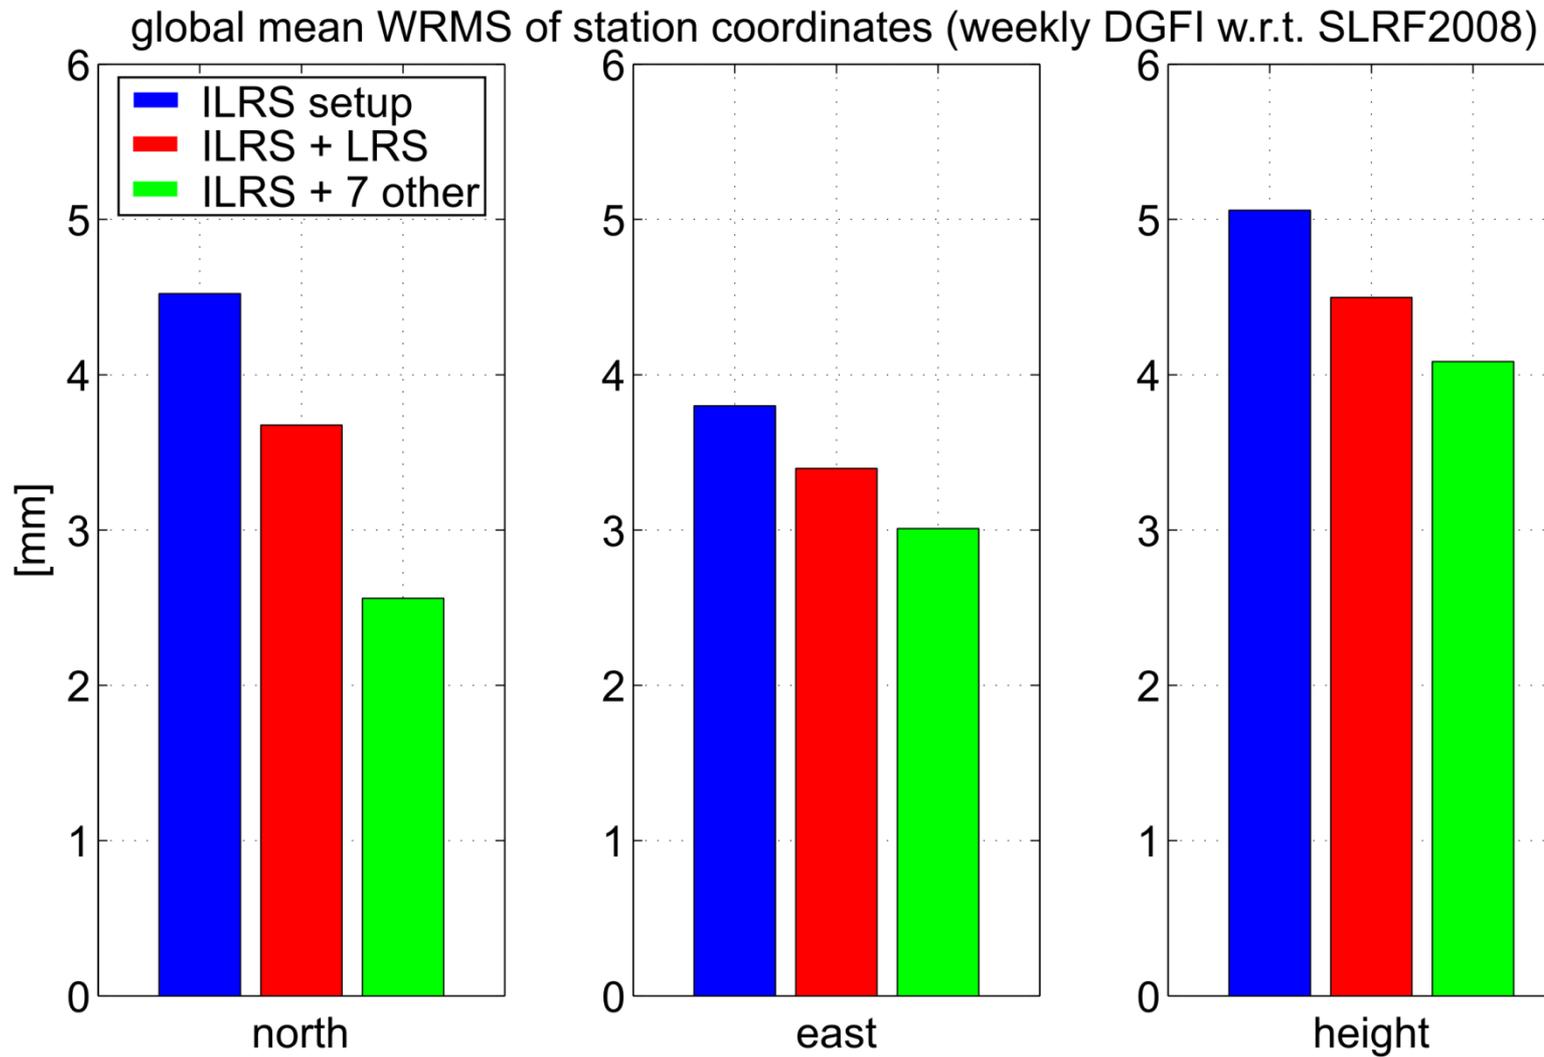

Either we get more etalon observations or we should remove Etalon from the satellites used for the ILRS products.

Report to ILRS DF&P WG

Randall Ricklefs
University of Texas
Center for Space Research

Need for Change to System Configuration Tracking

- 1) Must track changes to prevent discontinuities and errors in data and data products
- 2) Without tracking system changes, our data will not be competitive with other space geodesy techniques
- 3) Few stations posted changes in old SCH/SCI formats
- 4) Some stations found requirements confusing
- 5) SCI (system baseline) is redundant with site log

New System Configuration Tracking Procedure

- 1) Keep the site log up-to-date
- 2) Keep CRD configuration records up-to-date
- 3) Submit an email with the entire history log and new entries to ILRS at EDC whenever there is a significant change to the system
- 4) Follow quarantine procedures when a significant change to the measurement path is made

See http://ilrs.gsfc.nasa.gov/network/site_procedures/configuration_files.html

Implementing New Procedure

- 1) one time: Convert SCH file to history log, removing sequence number (which was rarely up to date) and adding subsystem ID (from site log)
- 2) One time: Discard SCH, SCI files and the CRD “60” (compatibility) record holding the SCH and SCI values.
- 3) When there is a change: Email entire change history log in email body or as an attachment to EDC every time there is a significant change – this could be automated at the station

Fields in New Change History Log

- Site Occupation Designator (SOD)
- Year, Day of Year, Hour and Minutes when change became active
- Estimated Chance of Data Impact: 0=none, ..., 3=needs quarantine
- Subsystem number of changed component from site log (or 99 for those not in site log)
- Text – to the end of the line describing change so that station and analyst can locate and identify

New Normal Point Definition

- 1) Allows high rep-rate systems to move to a new target once they have “enough” data, even if in much shorter time than the normal point bin size.
- 2) Allows station to more effectively interleave passes, with the attendant increase in data yield
- 3) Mainly pertains to high (HEO) and the LAGEOS satellites, which have long normal point bins
- 4) Went into effect May 2012
- 5) Possibly implemented at 13+ stations
 - Graz – real-time feedback, 1000 points/npt
 - Herstmonceux – real-time feedback on precision
- 6) Chart on next page shows the number of stations with > 1000 returns/npt. There is much potential for better interleaving with the new npt definition

New Normal Point Definition

High Return NPs – Sept 2013

Station	SOD	Mean # of returns per NP	Median # of returns per NP	MAX # of returns per NP	# NP's with >=1000 returns	Total # of NPs	Percent of NP's with >= 1000 returns	Number of Passes with 1-1000 returns	Total Number of Passes (TP)	Percent of Passes with >=1000 returns	Max. Rep. Rate (Hz)

By Justin Woo, Excelis

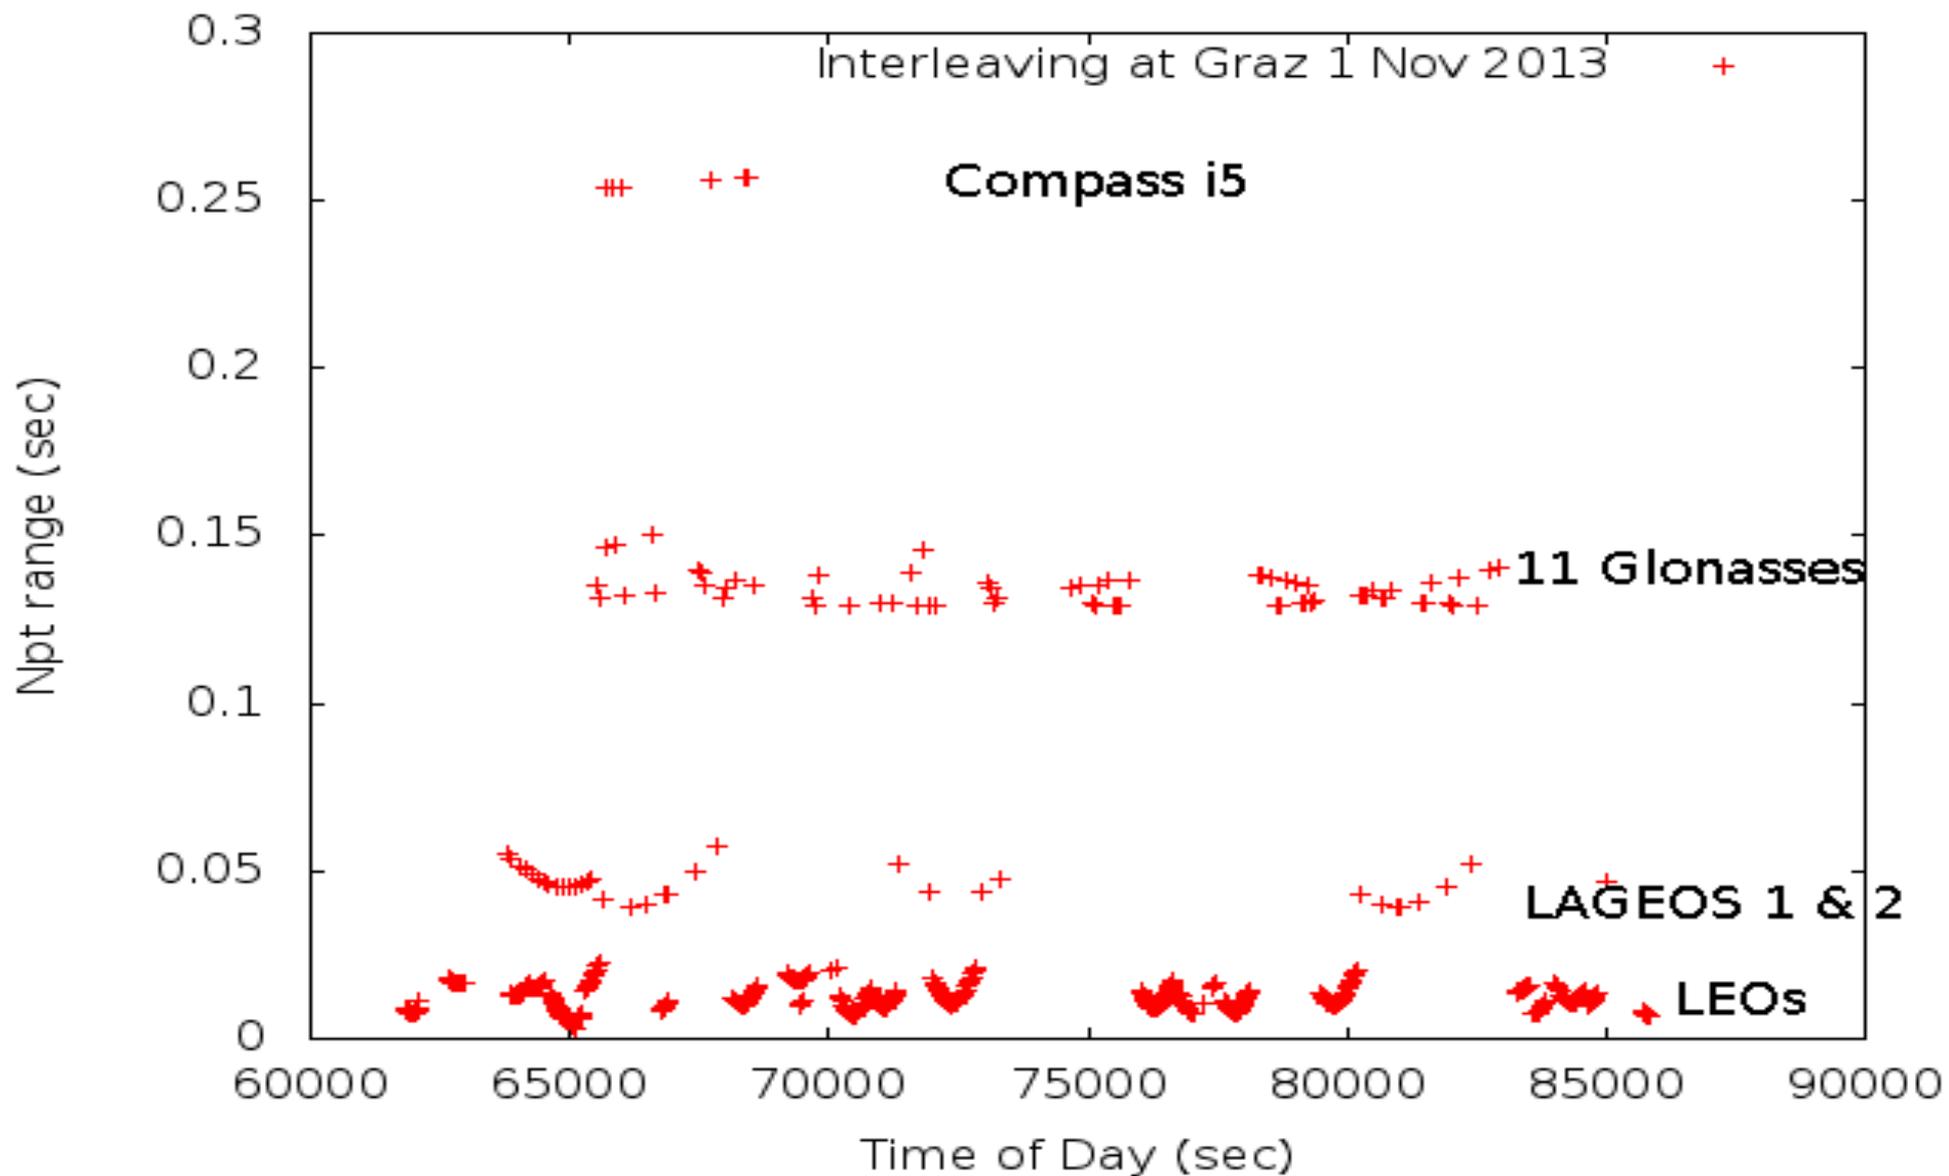

- Many stations have a high enough return rate to implement the new npt definition

November 9-15, 2013

Ricklefs DF&P WG Fujiyoshida

7

Recent Example of Interleaving Passes (Graz)

Software Library

- 1) Software is listed on new ILRS web site under the Technology menu
- 2) Would like to include Eurostat software. Contacting AIUB.
- 3) Do not yet have a normal point program, which would be useful for new stations
- 4) Have mount model fit program, but must replace a routine it uses from a copyrighted book
- 3) Concern about software licenses on new deposits on ILRS web site and any NASA constraints

System Change History Tracking Backup Slides from presentations in Frascati

System Change Reporting - I

- System change and station log files are needed by analysts to locate origin of data issues
- Problem: Stations are not updating their System CHange indicators and/or files (SCH):
 - Only 11 stations have updated their “sch” configuration file since 2003 and only 6 since 2008
 - Of 31 stations recently checked, 10 did not have “sch” files on CDDIS, 12 did not have SCH in CRD data, and 5 had SCH in CRD file that did not match “sch” file, and only 7 had it “right”
 - Station log files are not up-to-date

System Change Reporting - II

- Stations find current method of tracking station changes confusing and complex
- ILRS needs to find a better method of tracking changes. e.g.
 - Simplify
 - Possibly upload station maintenance files regularly
 - Possibly add software, meteorological, and other subsystems to CRD configuration section
 - Frequently remind stations to update information
- A proposal will be circulated to the ILRS N&E W/G soon

Configuration and Change Primer -I

- Need to track station changes and configuration so analysts can easily locate sources of changes in station performance
- SCH (System CHange) : indicator + description
 - This indicator is incremented whenever there is a “significant” change to the station's measurement chain
- SCI (System Conflguration) : indicator + description
 - The indicator and file entry are different for each standard operating configuration
 - Indicator implies changes in data characteristics
- The indicators are available in the old cstg format and the new CRD format
- Indicators and descriptions are kept in separate files on the ILRS web site for each monument/pad ID
- Station log and CRD configuration records contain much of the change information organized by sub-subsystem

Configuration and Change Primer -II

- When a station makes a change, according the to ILRS web site, in addition to possible requirement to quarantine and validate data, they must
 - Change the SCH indicator in normal points/full rate files
 - Add the new SCH and description to ILRS data base for via an email message
 - Change the SCI indicator in normal points/full rate files (if baseline changes)
 - Add the new SCI and description to ILRS data base for via an email message
 - Change CRD configuration records (if needed)
 - Update the station log (if needed)
- "It is up to the judgement of the station what should be included in this baseline description of the system, and what constitutes a significant change to the system."
- There is confusion at some stations about these files

Issues

- Stations are not updating their system configuration indicators or files (SCH):
 - Only 11 stations have updated their “sch” change file since 2003 and only 6 since 2008
 - Of 31 stations checked,
 - 10 did not have “sch” files on CDDIS;
 - 12 did not have SCH in CRD data (record 60);
 - 5 had SCH in CRD file that did not match “sch” file; and
 - only 7 had all information available and in sync

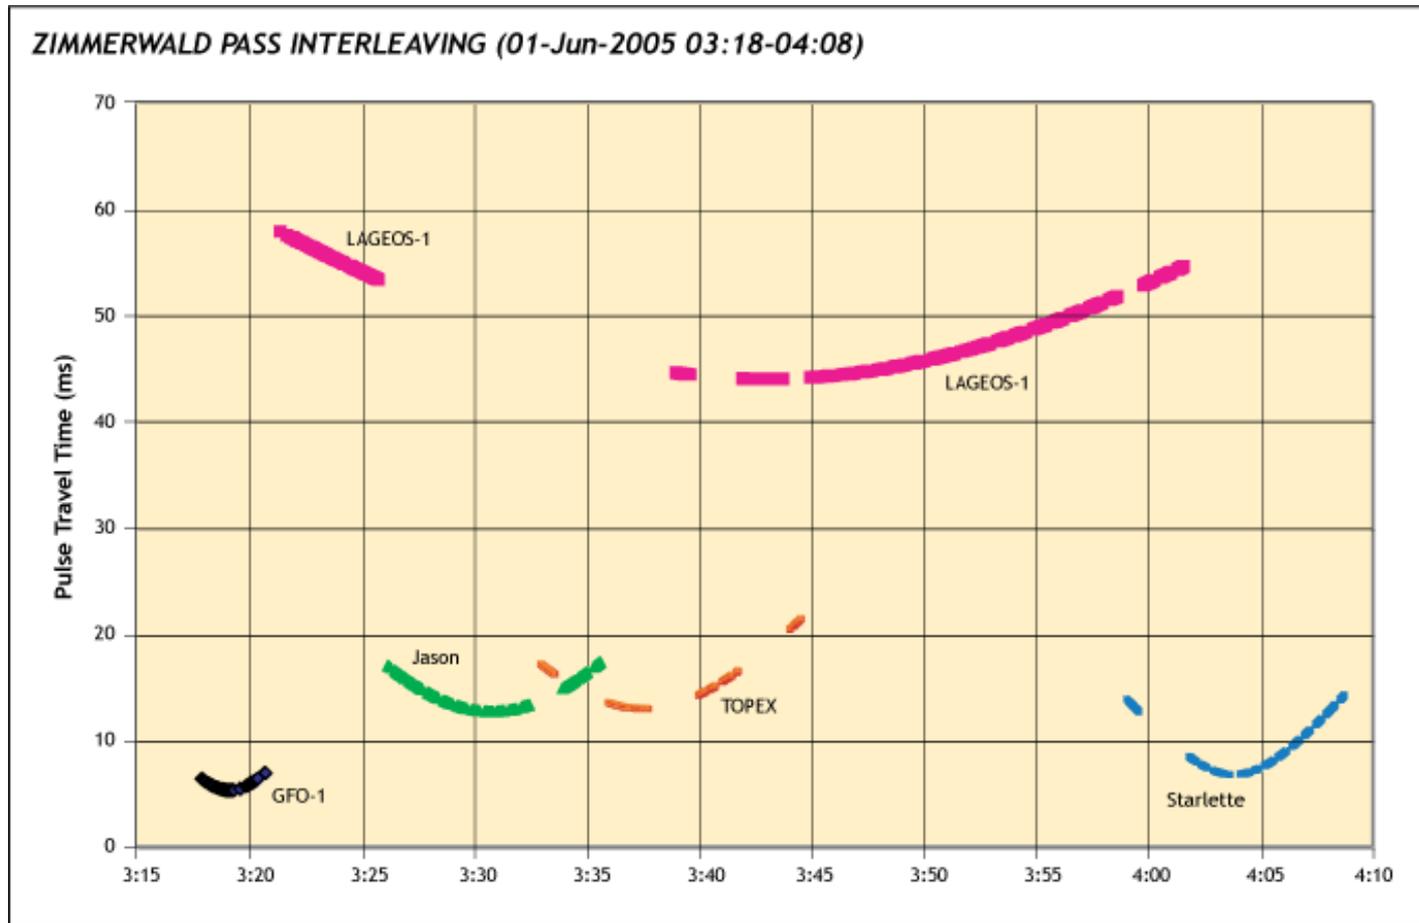

SCH/SCI in CRD

- Format was intended to end need for SCI/SCH by adding configuration records, but provided a location for indicators ("60" record); not fully implemented
- SCI: (alternate configurations) can, in principle, be handled properly by CRD configuration records
- SCH:
 - Some sub-systems are not in configuration records, like meteorological sensors and software (add?)
 - Some types of station changes can not be recorded in CRD or system log (e.g., cable changes, mirror recoating)
 - May not need SCH in CRD format if there is a way to deal with changes inserted and removed for testing

What do we do now?

- Remind stations to follow existing procedures, including use of CRD SCH/SCI ("60") record?
- Abandon SCI/SCH in favor of station log and CRD configuration records? (Loose some changes)
- Augment subsystems in CRD configuration records (e.g., met systems, telescope/mount, software, personnel :-))?
- Abandon CRD SCH/SCI record in favor of CRD configuration records; require SCH file update?

An early example of interleaving passes – from Zimmerwald

9th Nov. 2013

GRGS AC status

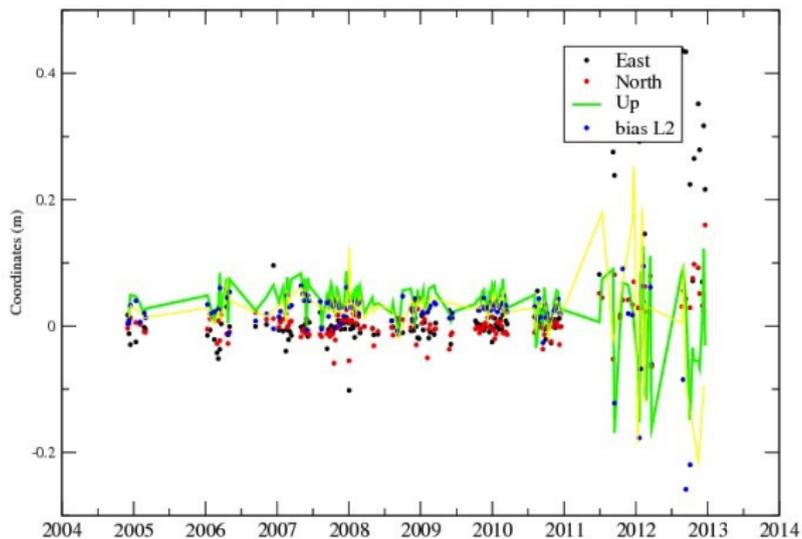

- fully operational
- New website: <http://vo.imcce.fr/slr-ac/>
 - operational solution
 - reanalyses
- test: change the weight of stations to evaluate the impact.
Impact very small except for LOD.
- Updates:
 - reanalysis in view of ITRF2013
 - on time for most of tasks
 - still to be done: SP3c format, data prior to 1992 period

LAG1 post fit residual level

JCET AC/CC REPORTS

Erricos C. Pavlis
GEST/UMBC

Magda Kuzmicz-Cieslak, Keith Evans and Daniel König
GEST/UMBC

ILRS AWG Meeting at 18th ILW, Fujiyoshida, Japan
Nov. 9, 2013

Activities since last AWG

- Analysis products submitted for DAILY (v135) & WEEKLY (v35) series
 - Combination products for corresponding DAILY & WEEKLY series continues with no major issues
 - Site information updates:
 - SCH-SCI database – NOW HISTORICAL !!!
 - We have a new data base which incorporates the historical information from the SCH-SCI database & continues seamlessly with the new records as provided since last month
 - We are working on incorporating the information in a visual manner on our webpages that display the products from each AC and CC, to help correlate the events with any anomalies in the data
 - We evaluated new coordinate solutions for a number of sites
-

Activities since last AWG (cont.)

- Station coordinate evaluation for ASI and DGFI solutions for several sites that required updates in SLRF2008, testing both over the period 1.1.2013 to present
 - We need to agree here TODAY on which of these should be adopted so that SLRF2008 can be updated prior to the reanalysis for the ITRF2013 contribution
 - NGSLR co-location data were evaluated and a separate talk during the workshop will cover that successful story
 - Yarragadee (7090) – Height change (~1 cm) in early 2010 seems to be more complex than earlier thought, showing a variety of different levels over significant amounts of time, without a clear explanation available from the local tests
-

Ocean Loading for SLR Sites

- GSFC's GOT4.7 tide model used
 - New file can be downloaded from:
 - http://geodesy.jcet.umbc.edu/OLOAD_4_220_SLR_sites.got4p7.iers.gz
 - Need to be maintained as new sites show up (e.g. Daedeok, Korea - 7359).
 - Same info available in Geodyn format also
 - http://geodesy.jcet.umbc.edu/OLOAD_4_220_SLR_sites.got4p7.gdyn.gz
-

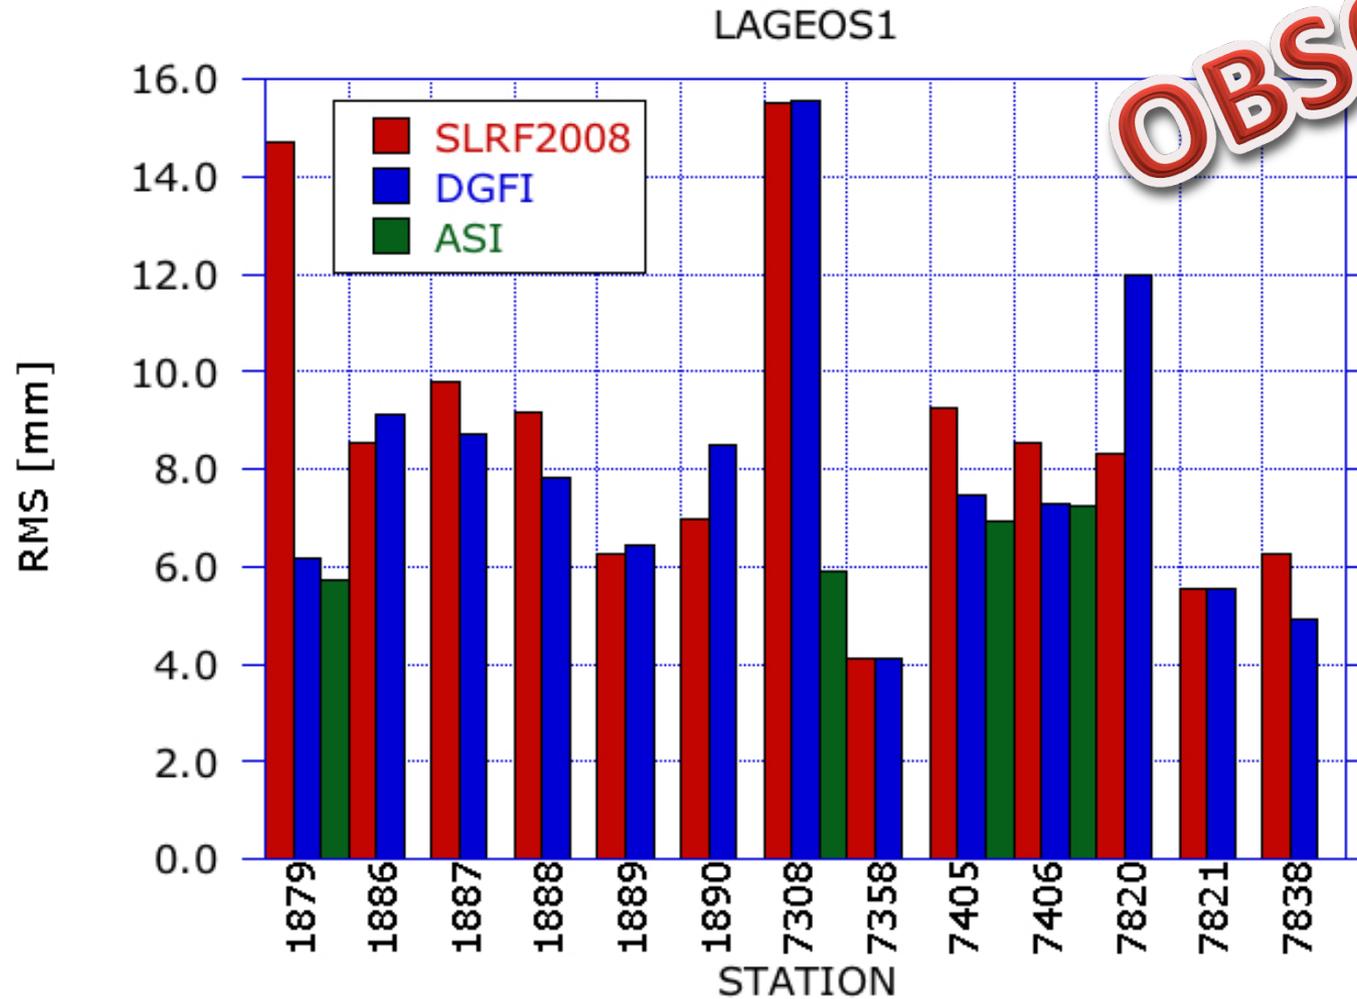

Activities since last AWG (cont.)

- We have invested significant effort in looking into the issues associated with LARES' response to ranging in the early days after launch, especially from kHz systems
 - Compared almost all available kHz FR data to NPs from the same stations
 - Graz FR data are not available at EDC, so these cannot be checked, and we are still working on the Changchun data due to the huge amounts compared to all other sites
 - So far, none of the stations checked has revealed a different response (range bias) at the same period as the satellite rotation (or any other period for that matter)
 - We would like to arrange with Graz to obtain some of their data, in part from just after the launch, a few passes a couple of months later and some in the recent months (if the entire data set is unavailable)
-

JCET QC Viewer

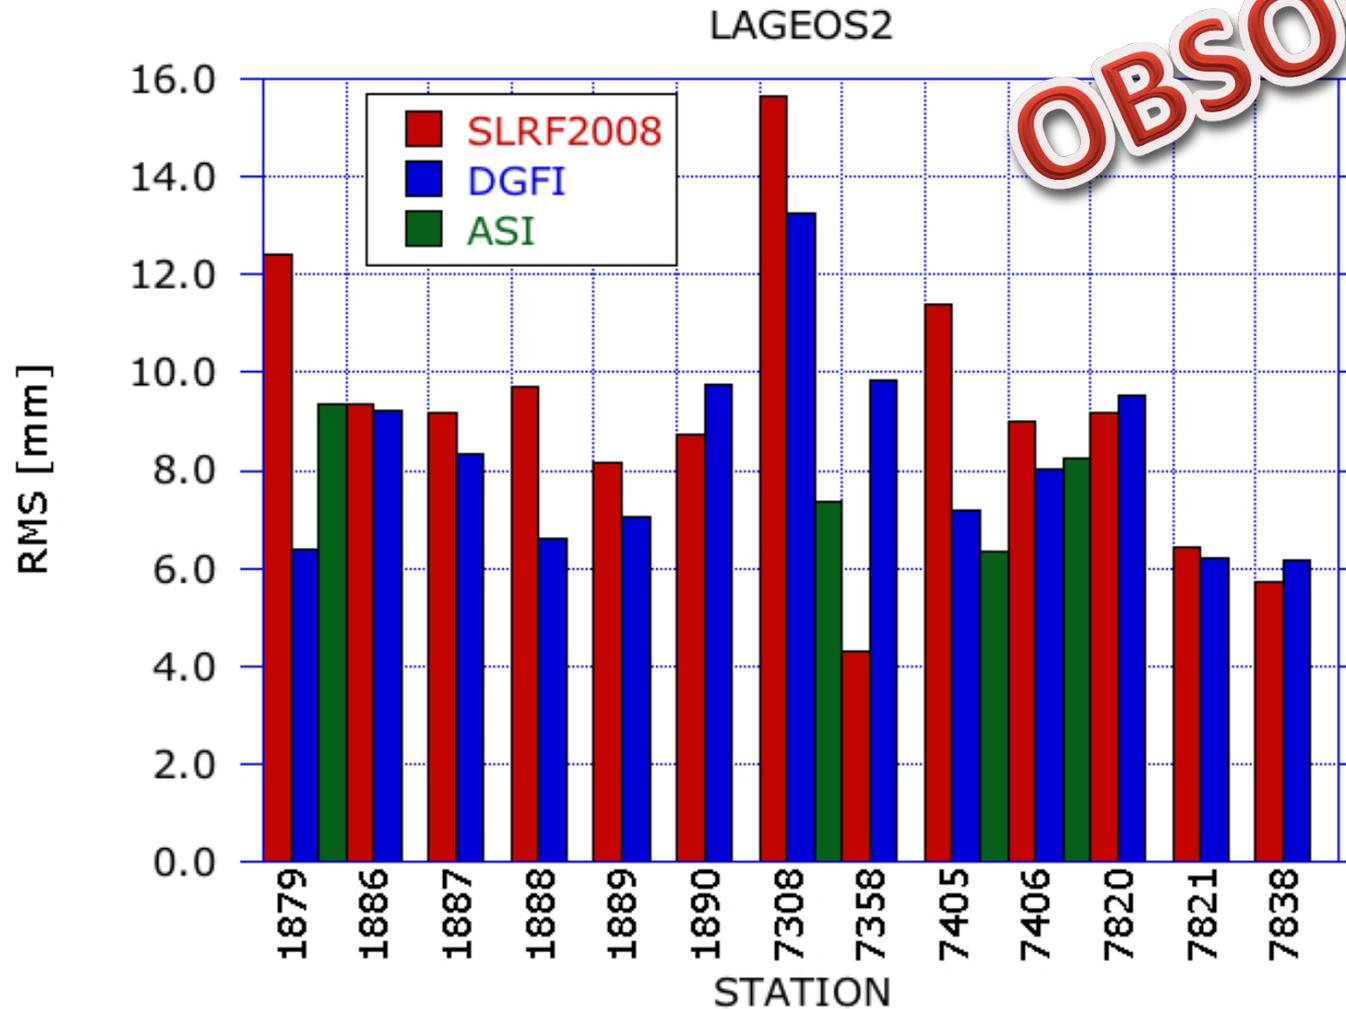

- The QC reports from each of the contributing ACs are in general formatted in a very tailored manner, containing different information, in different order, units, etc.
 - The information in these reports should be easily compared across AC, satellites, stations, evaluation metrics, etc., for these to be useful to the teams managing the various stations
 - In the past, the Graz team had devised a PC-based plotting package that was tailored to work with the UT/CSR reports, the only ones available at the time
 - JCET's MATLAB-based QC viewer works with ALL reports from DGFI, HITU, MCC, JCET, SHAO and (legacy) UT/CSR
 - The package will run on Mac★, Linux and Windows environments and it will be distributed with examples, a historical QC report data base (up to a certain date) and a simple user's manual (see poster at 18ILW)
- ★Needs some work to make it possible for all Mac OS X flavors
-

LLR Status Report

- 2013 -

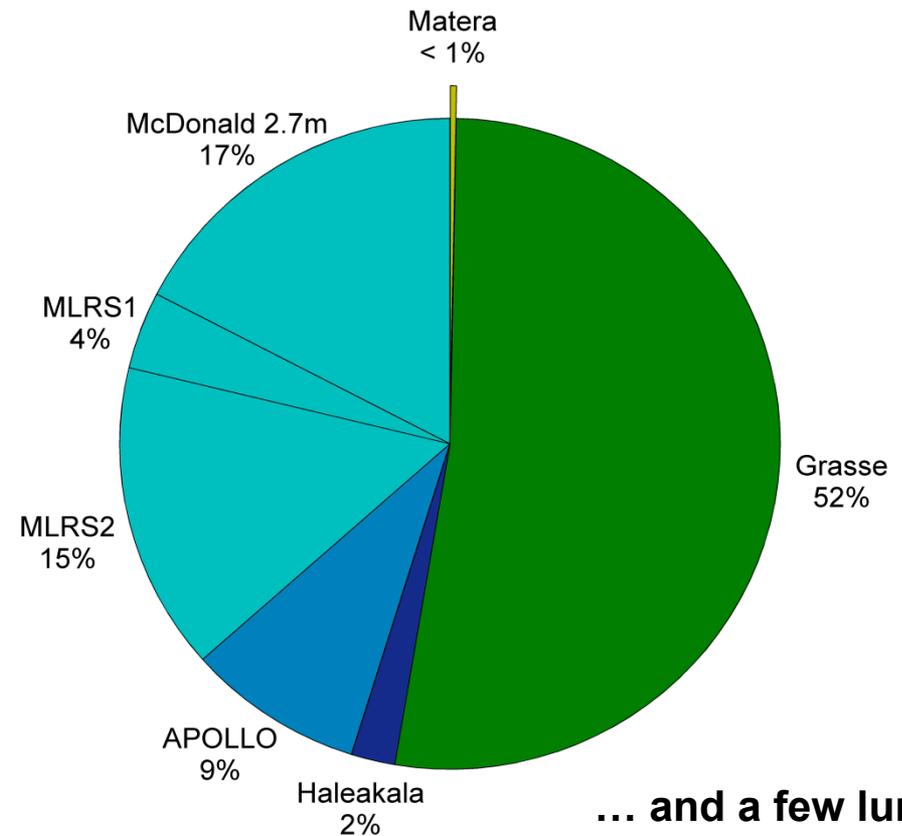

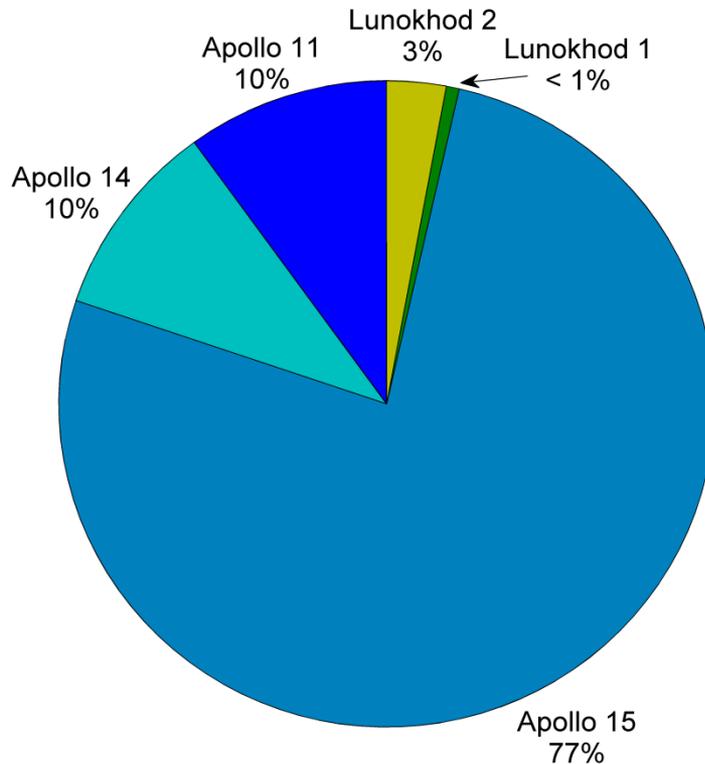

Jürgen Müller

**Institut für Erdmessung (Institute of Geodesy) and
Center of Excellence QUEST
(Quantum Engineering and Space-Time Research)**

Leibniz Universität Hannover (University of Hannover)

Statistics – retro-reflectors and observatories

Time span **1970-2013**

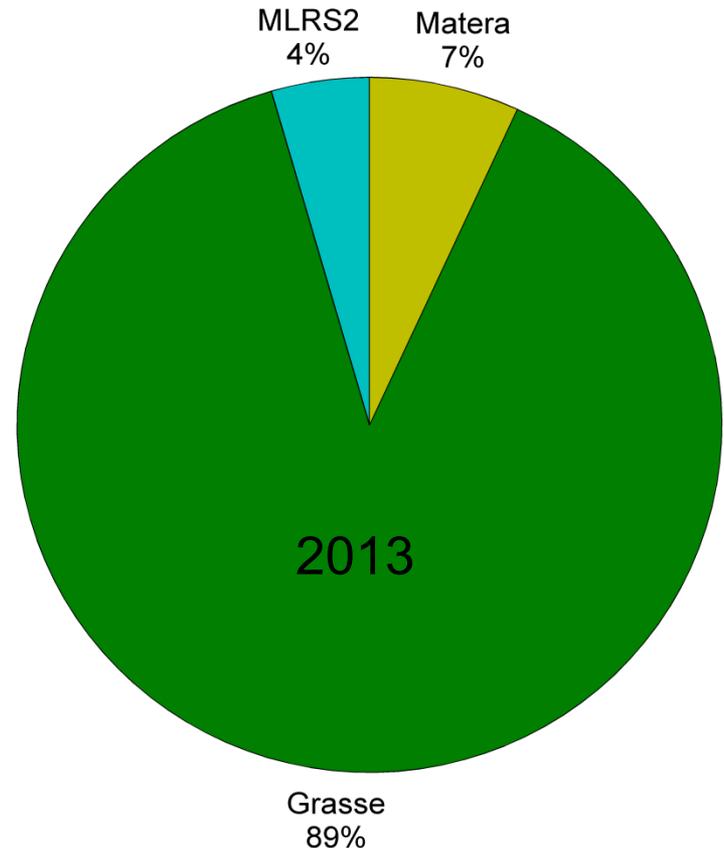

about 18,100
normal points

... and a few lunar
tracks from

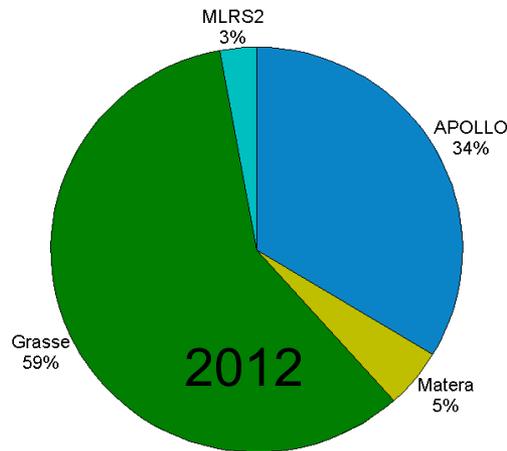

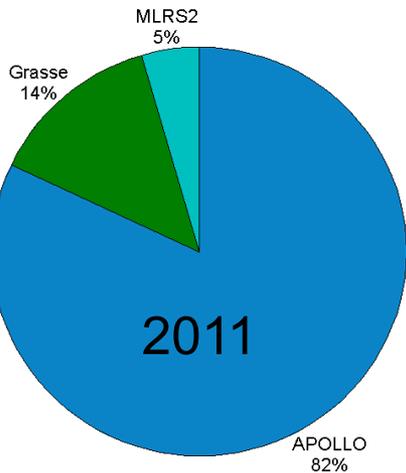

- Orroral
- Wettzell

Statistics – observatories 2013

Normal points	2012	2013
APOLLO	201	0*
McDonald	17	15
Grasse	351	296
Matera	28	23
In total	597	334

*APOLLO data of last year not released yet

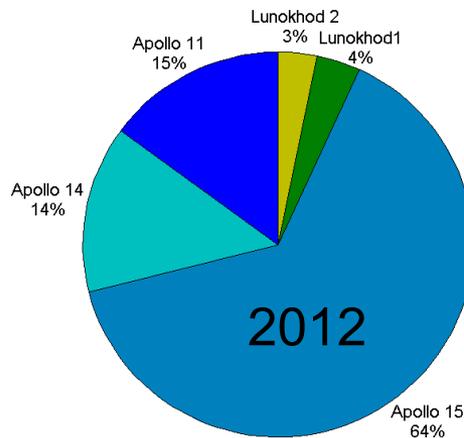

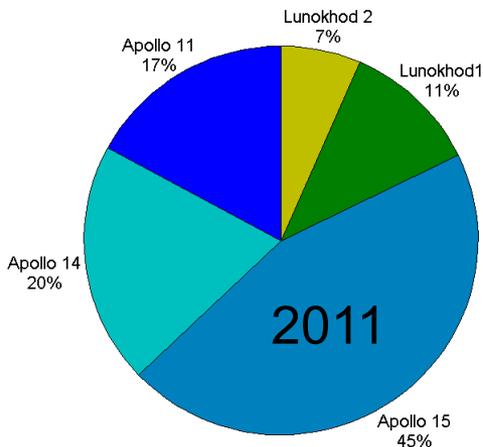

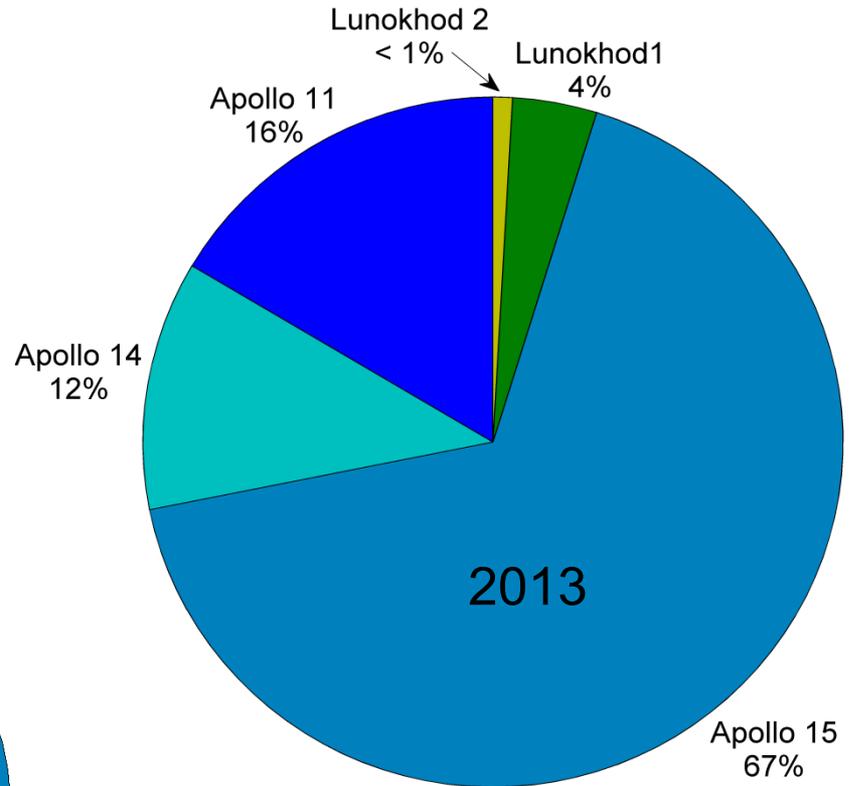

Status, perspective at the LLR sites

- McDonald - lunar tracking at low level
- Matera re-started in spring 2010 - lunar tracking at low level
- APOLLO - good LLR data until end of 2010 (new detector required refined processing → reduced accuracy, i.e. cm instead of mm level, problem fixed in 2012), pre-processing and release of 2013 data delayed
- Grasse re-started by end of 2009, good performance since end of 2011, more publications needed
- Wettzell LLR tracking is still pending

Statistics – retro-reflectors 2013

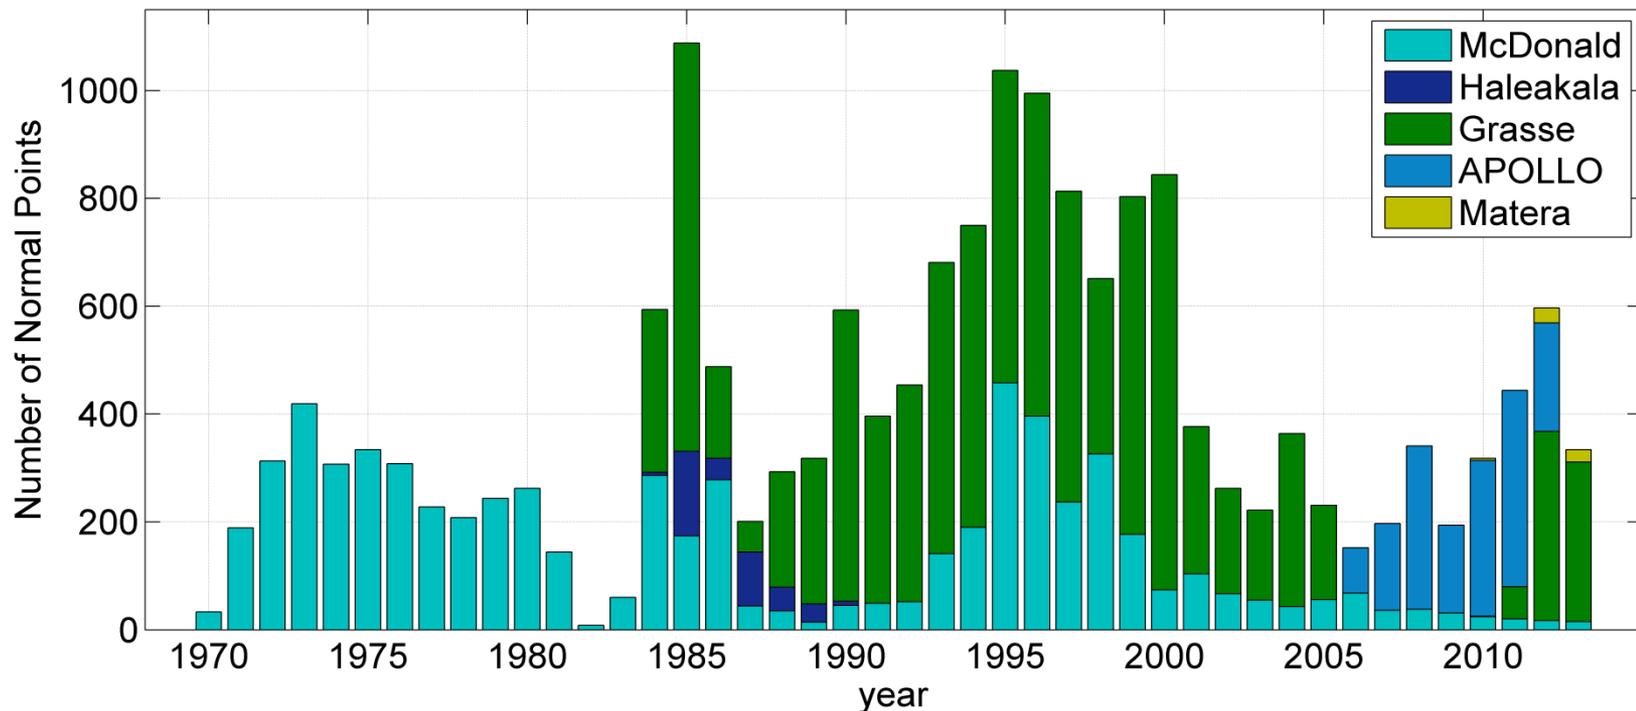

Normal points 2012 2013

Apollo 11	89	55
Apollo 14	84	39
Apollo 15	383	224
Lunokhod 1	22	13
Lunokhod 2	19	3
In total	597	334

Number of normal points

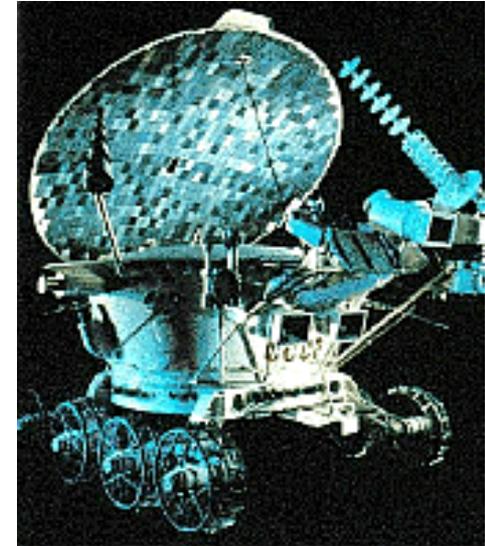

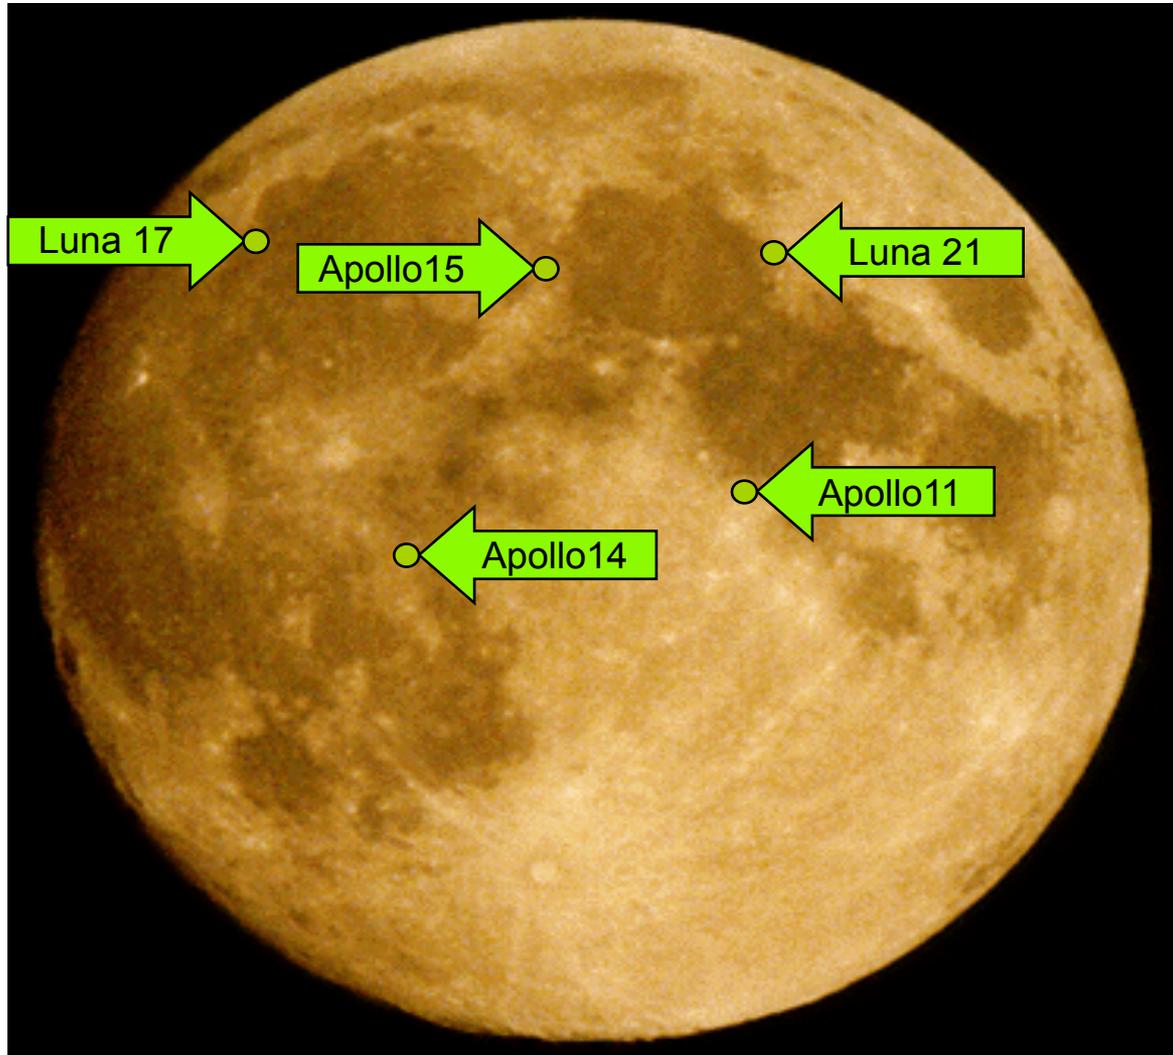

1970 - 2013: ca.18,100 normal points

Major LLR-related activities

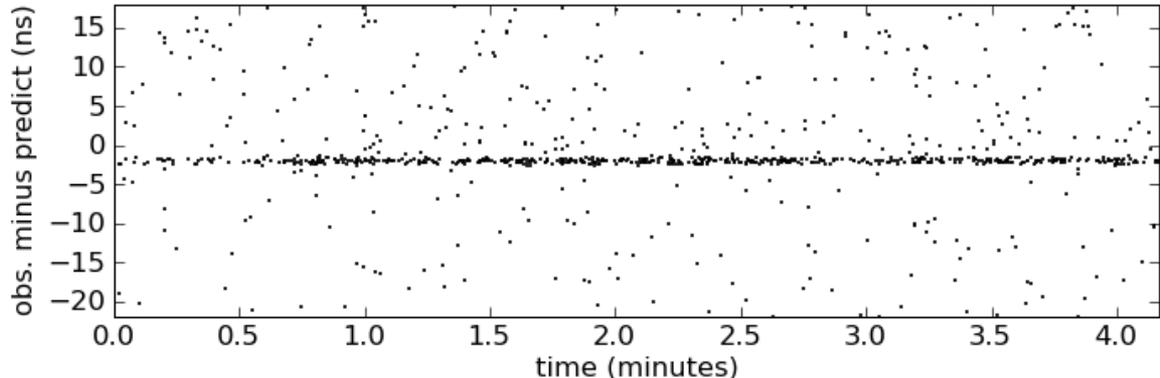

- Comparison of LLR software ongoing work between CfA (PEP)*, Paris (INPOP) and Hannover
- LLR part on ILRS website shall be updated
- Some debate about correctness of Lunokhod 2 range data (see next three slides)
- Data screening, homogenization of archived LLR data is still in progress
- Many LLR-related talks (IAG, EGU, GR20) and papers (CQG, IAG symposia series, Brumberg book ...) in the past years

Retro-reflectors on the Moon

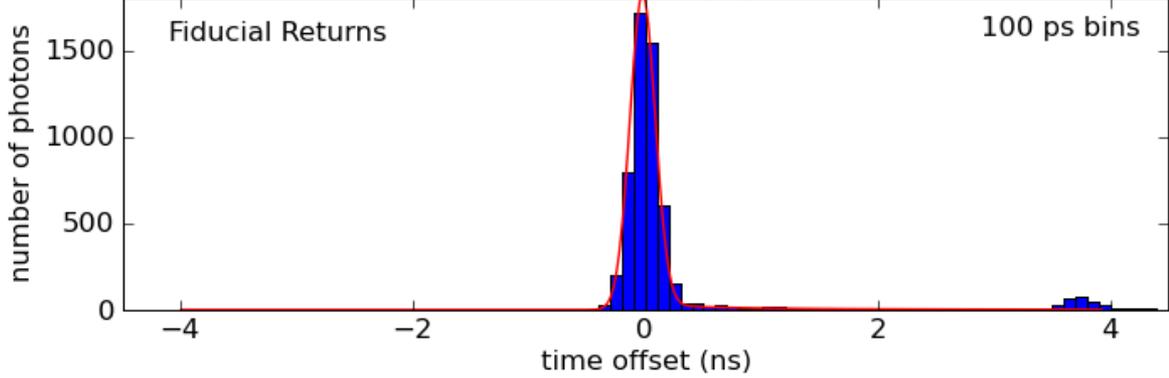

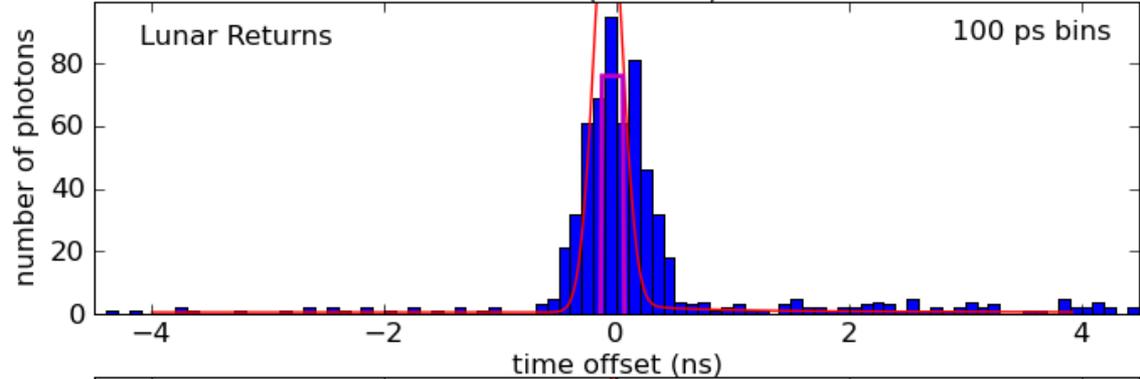

Lunokhod 2
