CHALMERS

**GGOS wants local ties at 0.1 mm level.
(currently ~1 cm)**

SP Technical Research Institute of Sweden

CHALMERS

~~GGOS wants local ties at 0.1 mm level~~

Interpretation

GGOS is striving for sub-mm accuracy and local ties must not be a limiting factor.

How good can local ties get?

What is the best practice?

SP Technical Research Institute of Sweden

CHALMERS

Global Geodetic Observing System (GGOS)

- Provides geodetic infrastructure necessary for monitoring global change research.
- **Integrates different geodetic techniques** in order to ensure long-term, precise monitoring of the observables.
- Provides the observations to maintain a **stable, accurate and global** reference frame
- Crucial for all Earth observations and many practical applications, e.g time keeping, data transfer...

CHALMERS

The Hows, Whats and Buts of Local ties

- *Recommended:* Pearlman M.R. (2008) (ed.)
Report of TLS (Terrestrial Laser Scanner) Workshop,
http://ilrs.gsfc.nasa.gov/docs/TLS_2008Workshop_Report.pdf
- Relate coordinate differences between the different techniques' reference points
 - geometric relations with respect to a local geodetic survey system.
 - full covariance information in temporal AND spatial domains
- Continuous, i.e automated monitoring systems
- Space geodesy dependent of measurements of imaginary points
 - Projections of elevation axis on azimuth axis (SLR, VLBI)
 - Phase center of antennas (GNSS,DORIS)

SP Technical Research Institute of Sweden

CHALMERS

Cold Magics – Continuous Local Deformation Monitoring at an Arctic Fundamental Station

- VLBI – GNSS local tie at Ny Ålesund, 2009
- PC-controlled single robotic total station monitoring system
- Movements larger than uncertainty bands
- Indication of diurnal movements

• No 0.1 mm local ties this way...

SP Technical Research Institute of Sweden

CHALMERS

Evaluation of GNSS monument stability

- To appear in REFAG2010 Proceedings
- PC-controlled double robotic total station monitoring
- Length scale calibrated and verified interferometrically
- Solar flux measurements

Continuous Cartesian Connection basics

- Measurements of same temporal order as perturbations
- Transformations between global Cartesian coordinate systems with Local Truly Cartesian (LTC) coordinate systems
- Avoid measuring redundant parameters: Simplify!
- Get partners – detailed knowledge in several fields is needed.
- Use state of the art equipment for every measurement task:
 - Laser trackers for interferometric length measurements
 - Robotic total stations for monitoring
 - Monitor environmental parameters densely
- Utilize best practice methods, modify them if unavoidable
- Separate observable from connecting vector.
- Method described in submitted paper

GGOS is striving for sub-mm accuracy and local ties must not be a limiting factor.

Can Continuous Cartesian Connections realize local ties at 0.1 mm level?

Still no...

How good can local ties get?

Utilizing the CCC concept:

Probably below 0.5 mm

SP Technical Research Institute of Sweden
